## GENERAL

This addendum documents a change to the RX Front End Module (19D902782G3, G4, \& G7) Maintenance Manual. Torque specification changed from 20 in-lbs. to $12.5 \pm 2.50$ in-lbs.

## CHANGES

On page 6, update drawing 19D902782 with revision 10.

(19D902782, Rev. 10)

ADDENDUM NUMBER 1 TO MAINTENANCE MANUAL

## GENERAL

This addendum adds a production change to Receiver Front End Module Maintenance Manual 19D902782G3, G4, and G7.

On page 4, add the following to the list of production changes:
REV. C - RECEIVER FRONT END BOARD 19D902490G4
To improve pass rate during conversion loss test and to replace obsolete part, inductor L19 was changed from 15 mH inductor (19A705470P3) to a 12 mH (19A705470P2) inductor.

Replace schematics 19D904768, Sh. 1, Rev. 7 on page 8 and 9 of the manual with revision 8 (see page 1 and 2 ).

## DESCRIPTION

The Receiver Front End (RXFE) Module amplifies and converts the RF signal to the first IF signal of 21.4 MHz. This is a down conversion process using low side is powered by a regulated 12 volts. The RXFE printed wiring board contains the following functional circuits:

- Preselector Filter
- Preamplifier

## tyco

Electronics

- Image Rejection Filter
- Injection Amplifier
- Injection Filter
- Double Balanced Mixer
- Fault Detector

All but the Fault Detector circuit in the RXFE mod ule have 50 ohm impedance terminations.

| Table 1-General Specifications |  |
| :---: | :---: |

## CIRCUIT ANALYSIS

## PRESELECTOR FILTER

The received RF signal (J2) is routed through the Preseector Filter. This filter provides front end selectivity and attenuates the potential spurious signals of first conversion. Typically, the filter has an insertion loss of 3 dB and an five-pole helical bandpass filter (L1 thru L5) and is tunable in the band split ( $450.0-470.0 \mathrm{MHz}$ or $425.0-450.0 \mathrm{MHz}$ ) range.

## PREAMPLIFIER

The output from the Preselector is coupled through a mpedance matching network consisting of L6, C2, and DC broadband common emitter amplifier. The Preamplifier stage is supplied by the regulated +12 Vdc line (VCC1) and draw about 70 mA through R4. It has a low noise figure and high Third Order Intercept point. Transistor Q2 provides Q1 with constant voltage and current source. The bias on Q1 is moni

Ted by the Fault Detector circuit via R17. Capacitors C20 an C21 prevent the RF component from entering the fault circuit The output signal is coupled to the Image Rejection Filter vi impedance matching network consisting of $\mathrm{C} 4, \mathrm{~L} 8$, and esistors R5 and R6.

## IMAGE REJECTION FILTER

Following the Preamplifier is the Image Rejection Filter The Image Rejection Filter is a fixed tuned helical bandpas filter and can meet the desired image rejection of the frequency band.

## INJECTION AMPLIFIER

The local oscillator input (J3) from the Receiver Synthe sizer is coupled through an impedance matching network (C5 and L9) to the base of the Injection Amplifier Q3. Q3 and Q8 are common emitter amplifiers. The output from Q3 is coupled the base of Q8. The Injection Amplifier, consisting of Q3 $\mathrm{Q8}$ and associated circuitry is capable of amplifying the injection signal from 0 dBm to +25 dBm in the 428 to 449 MHz range

Figure 1 - Block Diagram
or to +18 dBm in the $446-472 \mathrm{MHz}$ range. The amplifier is owered by the regulated +12 Vdc line (VCC1). Transistor Q4 and Q7 provide Q3 and Q8 with a constant voltage and urrent source. The bias on Q3 and Q8 is monitored by the ors C22, C23 and C26 prevent the RF component from entering the fault circuit. The output signal is coupled to the Injection Filter via an impedance matching network consisting of C8, L13, and resistors R15 and R16

## INJECTION FILTER

Following the Injection Amplifier is the Injection Filter consisting of C9 through C19, L14 through L20, and R30. Configured as a bandpass filter, the Injection Filter has G7) and is used to attenuate the harmonics of the Injection Amplifier. The filter also has an insertion loss of about 2 dB .

## DOUBLE BALANCE MIXER

The Double Balance Mixer (DBM) is a broadband The Double Balance Mixer (DBM) is a broadband
mixer It converts an RF signal to the 21.4 MHz first conver-
sion IF frequency. The mixer uses low side (G3, G4) or high side (G7) injection driven by a local oscillator signal of +20 (G3, G4) or +15 (G7) dBm. The mixer conversion loss is typically about 6.5 dB . The IF output signal is then route o the output connector (J4)

## FAULT DETECTOR

The Fault Detector circuit monitors the operation of preamplifier and injection amplifier devices. Operationa amplifiers U1.1 and U1.2 compare the bias on the Preamplifier Q1 to preset levels, while U1.3 and U1.4 compare the bias levels on Injection Amplifiers Q3 and Q8

When the bias for $\mathrm{Q} 1, \mathrm{Q} 3$, and Q 8 is within the preset window limits, the output from the comparators is a high level. This causes Q5 to conduct, turning off Q6 and the fault indicator, CR2. A high level signal is also sent to the Controller on the FLAG 0 line.

If the biasing for the amplifiers is not within the proper operating range, the fault detector circuit will pull the FLAG
0 line low. This turns off Q causing Q6 to conduct Q6 now 0 line low. This turns off Q5 causing Q6 to conduct. Q6 now
provides a ground path for CR2, turning on the fault indicaprovi

## MAINTENANCE

## TEST PROCEDURE

The RXFE module has to be tested for Noise Figure, Gain, Third Order Intercept Point, Isolation etc. With proper current drawing of devices, Bandwidth and Conversion Gain the RXFE module will meet its specifications. The following test procedures will verify proper Conversion Gain and current drain:

1. Supply 12 Vdc to pin $15 \mathrm{~A}, \mathrm{~B}, \mathrm{C}$. ( 1 C is ground.)
2. Inject the desired RF signal into RF IN at a level of -10 dBm .
3. Inject the desired local oscillator signal into LO IN at a level of $0 \mathrm{dBm}[\mathrm{LO}$ frequency $=\mathrm{RF}$ frequency at a level of 0 dBm [LO frequency $=\mathrm{RF}$
4. Measure the IF OUT power at 21.4 MHz , the ratio of RF IN to IF OUT is $-2 \mathrm{~dB} \pm 1 \mathrm{~dB}$.
5. Measure the current drawn by the RXFE module. Typical current drain is 290 mA .

## ALIGNMENT PROCEDURE

Alignment for the Receiver Front End module consists Alignme five-pole Preselector Filter only Normally the RXFE should only need the fine-tuning procedures. For a major receiver frequency change, the RXFE needs to be adjusted using the major-retuning procedures.

## For Fine-Tuning

1. Supply 12 Vdc to pin $15 \mathrm{~A}, \mathrm{~B}, \mathrm{C}$. ( 1 C is ground.)
2. Inject the desired RF signal into RF IN (J2) at a level of -10 dBm .
3. Inject the desired local oscillator signal into LO IN (J3) at a level of $0 \mathrm{dBm}[\mathrm{LO}$ frequency $=\mathrm{RF}$ frequency -21.4 MHz (G3, G4) +21.4 MHz (G7)].
4. Detect IF signal at 21.4 MHz . Slightly adjust L 1 to 5 to get maximum power (don't adjust more than
en degrees). If an RF Voltmeter is used, connect a Low Pass Filter (LPF) to the IF OUT (J4) to attenuate high frequency components. The corner of the LPF
should be set for 40 MHz . should be set for 40 MHz .
5. Repeat Test Procedure steps to verify conversion gain and current drain.

## For Major-Retuning

The best way to do a major retuning of the RXFE is with
 swept frequency tuning. The swept frequency tuning can be
done using a Spectrum Analyzer and Tracking Generator. With proper Injection power and current drain, the frequency response of the Preselector Filter can be seen by viewing the RF to IF port feedthrough on the spectrum analyzer. This feedthrough is typically 35 dB down from the input level at the RF port. Use the following procedure for swept frequency tuning:

1. Supply 12 Vdc to pin $15 \mathrm{~A}, \mathrm{~B}, \mathrm{C}$. ( 1 C is ground.)
2. Inject the Tracking generator output at 0 dBm into the RF IN connector, (J2).
3. Inject local oscillator power at 0 dBm into the LO IN connector, (J3) [LO frequency $=$ RF frequency -21.4 $\mathrm{MHz}(\mathrm{G} 3, \mathrm{G} 4)+21.4 \mathrm{MHz}(\mathrm{G} 7)]$.
4. Preset the height of slugs with respect to the top of five-pole cavity as follows (Table 2):

Table 2

| Frequency <br> (MHz) | HEIGHT (in inches) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | L1 | L2 | L3 | L4 | L5 |  |
| 450 | $15 / 64$ | $16 / 64$ | $17 / 64$ | $17 / 64$ | $16 / 64$ |  |
| 454 | $16 / 64$ | $17 / 64$ | $17 / 64$ | $18 / 64$ | $15 / 64$ |  |
| 458 | $16 / 64$ | $19 / 64$ | $19 / 64$ | $19 / 64$ | $17 / 64$ |  |
| 462 | $18 / 64$ | $19 / 64$ | $20 / 64$ | $20 / 64$ | $18 / 64$ |  |
| 466 | $21 / 64$ | $22 / 64$ | $23 / 64$ | $21 / 64$ | $20 / 64$ |  |
| 470 | $22 / 64$ | $24 / 64$ | $24 / 64$ | $23 / 64$ | $22 / 64$ |  |

5. Center the spectrum analyzer at the desired frequency and set the reference at about -30 dBm . Adjust L1 to L5 for best possible response.

TROUBLESHOOTING GUIDE

| SYMPTOM | AREAS TO CHECK | READING (TYP.) |
| :---: | :---: | :---: |
| LOW CONVERSION GAIN | Check Vcc | 12 V |
|  | Preselector Loss | 3.5 dB |
|  | Preamplifier Gain | 11 dB |
|  | Image Rej. Filter Loss | 2 dB |
|  | 1st Mixer Conversion Loss | 6.5 dB |
|  | 1 L.O. Level (@ mixer L.O. port) | $\begin{aligned} & +22 \pm 2 \mathrm{dBm}(\mathrm{G} 3, \mathrm{G} 4) \\ & +14 \pm 2 \mathrm{dBm}(\mathrm{G} 7) \end{aligned}$ |
| LED INDICATOR ON | Check Vc of Q1 | 10 V |
|  | Check Vc of Q3 and Q8 | 10 V |
| IF FREQUENCY OFF | Check L.O. FREQUENCY | $\begin{aligned} \text { L.O. frequency }=\text { RF frequency } & -21.4 \mathrm{MHz}(\mathrm{G} 3, \mathrm{G} 4) \\ & +21.4 \mathrm{MHz}(\mathrm{G} 7) \end{aligned}$ |
| LOW L.O. POWER* | Injection Amplifier Gain | $\begin{aligned} & 23 \pm 2 \mathrm{~dB}(\mathrm{G} 3, \mathrm{G} 4) \\ & 18 \pm 2 \mathrm{~dB}(\mathrm{G} 7) \end{aligned}$ |
|  | Injection Filter Loss | 2 dB |

* NOTE: For troubleshooting the gain or loss, the RXFE needs to be under the normal operating condition:
- 12 Vdc supply
- Inject L.O. power at a level of 0 dBm into LO IN (J3), [LO freq. $=$ RF freq. $-21.4 \mathrm{MHz}(\mathrm{G} 3, \mathrm{G} 4$ +21.4 MHz (G7)
- Inject the desired RF signal at a level of - 10 dBm into RF IN (J2)
- Terminate the IF OUT (J4) with a good 50 ohm impedance.
- Use a Spectrum Analyzer and 50 ohm probe (with good RF grounding) to probe at the input and output of each stage to check its gain or loss (see schematic diagram).

production changes
Changes in the equipment to improve or to simplify circuits are
identified by a "Revision Letter", which is stamped after the model number of the unit. The revision stamped on the unit includes all number of the unit. The revision stamped on the unit includes all
previous revisions. Refer to the Parts List for descriptions of parts
affected by these revisions.
REV. A - RECEIER FRONT END BOARD 19D902490G3 REV. B-RECEIVER FRONT END BOARD 19D902490G3 REV. A - RECEIVER FRONT END BOARD 19D902490G4 To correct overheating problem.
R14 was 10 ohms (198800607P100).
REV. C-RECEIVER FRONT END BOARD 19D902490G3 switching power supply frequency.
Added C29, C30, C31, C32 and L24.

PRODUCTION CHANGES - CONT REV. B -RECEIVER FRONT END BOARD 19D902490G4 REV. A - RECEEVER FRONT END BOARD 19D902499G7 switching power supply frequency.
Added C37, C38, C39, C40 and L24.
REV. B-RECEIVER FRONT END BOARD 19D902490G7 To improve receiver sensitivity L8 changed from
 55 changed from 10 ohms (198800607P100) R14 changed from 18 ohms (19B800607P180) to 27 onts (19B800607P270); (19B800607P391)
R6 (198800607P391) and R36 ( were deleted.
REV. D-RECEIVER FRONT END BOARD 19D902490G3 Reduce excessive LO drive level. Changed R15 from
10 ohms (198800607P100) to 27 ohms (198800607P270). Changed R16 from 390 ohms (1988800607P391) to Changed R16 from 390 ohms
180 ohms (19B800607P181).
Rev. 1A - Receiver Front End Module 19D902782G4 \& G7 To reduce RF emissions, the conductive connector grommet
was replaced with a thicker part to ensure contact with the was replace w wh a thicker part to ensure contact with the
front panel at R R connectors. RF Shielding Grommet was
thanged fro 1 . changed from 198802690P1 to 19D802690P2.
