**SERVICE
MANUAL**

VHF TRANSCEIVER

IC-H16T MKII

Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-H16T MKII** VHF TRANSCEIVER at the time of publication.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110000070	IC	μPC358C	IC-H16T MK II	MAIN UNIT	5 pieces
8810002050	Screw	FH M2×4	IC-H16T MK II	CHASSIS PARTS	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 30 dB~40 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

GENERAL

- Frequency coverage : 146~174 MHz
Ask your Icom Dealer about the permitted frequency range in your area.
- Frequency bandwidth : 28 MHz
- Mode : 16K0F3E (#34, #37, #38, #45, #46, #47)
14K0F3E (#42)
8K50F3E (#33, #36, #39, #40, #41, #43, #44, #48, #49)
- Channel spacing : 25 kHz (#34, #37, #38, #45, #46, #47)
20 kHz (#42)
12.5 kHz (#33, #36, #39, #40, #41, #43, #44, #48, #49)
- Number of channels : Up to 16
- Usable battery pack :

BATTERY PACK	OUTPUT VOLTAGE
CM-7B	13.2 V/450 mAh
CM-8B	8.4 V/800 mAh
CM-96B	8.4 V/1200 mAh
- Antenna impedance : 50 Ω (unbalanced)
- Current drain (with CM-8B) :

Receive	Stand-by	80 mA
	Max. audio output	250 mA
Transmit	High	1.3 A
	Low	750 mA
- Usable temperature range : $-25^{\circ}\text{C} \sim +60^{\circ}\text{C}$ ($-13^{\circ}\text{F} \sim +130^{\circ}\text{F}$)
- Frequency stability : ± 5 ppm ($-25^{\circ}\text{C} \sim +60^{\circ}\text{C}$; $-13^{\circ}\text{F} \sim +140^{\circ}\text{F}$)
- Dimensions (with CM-8B) : 65 (W) \times 196 (H) \times 38 (D) mm
2.5 (W) \times 7.7 (H) \times 1.5 (D) in
(Projections not included.)
- Weight (with CM-8B) : 596 g (1.3 lbs)

TRANSMITTER

- Output power : High 5 W (with CM-7B)
3 W (with CM-8B or CM-96B)
Low 1 W (with CM-7B, CM-8B or CM-96B)
- Modulation system : Variable reactance frequency modulation
- Max. frequency deviation : ± 5 kHz (#34, #37, #38, #45, #46, #47)
 ± 4 kHz (#42)
 ± 2.5 kHz (#33, #36, #39, #40, #41, #43, #44, #48, #49)
- Spurious emissions : $< 0.25 \mu\text{W}$
- Harmonic emissions : $< 0.25 \mu\text{W}$
- FM noise and hum : < -40 dB

RECEIVER

- Receiver system : Double-conversion superheterodyne
- Intermediate frequency : 1st 21.8 MHz 2nd 455 kHz
- Sensitivity : 0.35 μV (PD) for 12 dB SINAD, signal input modulated by 1 kHz tone at 60 % peak deviation
- Squelch sensitivity (threshold) : 0.4 μV
- Adjacent channel selectivity : > 70 dB (#34, #37, #38, #42, #45, #46, #47)
 > 60 dB (#33, #36, #39, #40, #41, #43, #44, #48, #49)
- Intermodulation rejection : > 70 dB
- Spurious and image rejection : > 70 dB
- Audio output power (with CM-8B) : 500 mW 10 % distortion with an 8 Ω load
- Audio output impedance : 8 Ω

All stated specifications are subject to change without notice or obligation.

SECTION 3 BLOCK DIAGRAM

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (PLL UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals enter the antenna connector and pass through a two-stage Chebyshev low-pass filter (L221, L222, C262~C266) to suppress out-of-band signals. The filtered signals are applied to the $\lambda/4$ type antenna switching circuit (D218, D220, L220, C267, C268) and then to a two-stage bandpass filter (L207, L208, D208~D211, C221, C225).

4-1-2 RF CIRCUIT (PLL UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the bandpass filter are applied to the RF amplifier (Q203). The amplified signals enter a three-stage bandpass filter (L204~L206, D202~D207, C215, C218) to suppress unwanted signals.

D202~D211 employ varactor diodes, that are controlled by the PLL lock voltage, to track the bandpass filters. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

4-1-3 1ST MIXER AND IF CIRCUITS (PLL UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the RF circuit are mixed at Q202 with a 1st LO signal coming from the VCO circuit to produce a 1st IF signal. The 1st IF signal is applied to L203 and then to a pair of crystal filters (FI201) in order to obtain wide selection capability and to pass only the desired signals. The filtered signal passes through a 1st IF amplifier (Q201). The amplified signal is applied to a 2nd IF circuit.

4-1-4 2ND IF AND DEMODULATOR CIRCUITS (MAIN UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from Q201 on the PLL unit is applied to a 2nd mixer section of IC102 (pin 16) and is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC102 contains the 2nd mixer, local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X1 generate 21.345 MHz for the 2nd LO signal.

• 2ND IF AND DEMODULATOR CIRCUITS

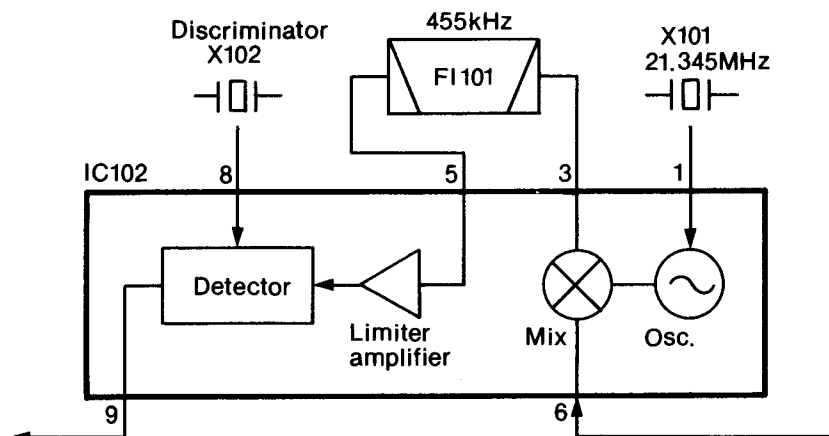

Fig. 1

The 2nd IF signal from the 2nd mixer (IC102, pin 3) passes through a high-quality ceramic filter (F1101) to suppress unwanted heterodyned frequency signals. It is then amplified at the limiter amplifier section (IC102, pin 5) and applied to the quadrature detector section (IC102, pin 8) and ceramic discriminator (X102) to demodulate the 2nd IF signal into an AF signal. The AF signal is output from IC102 (pin 9).

4-1-5 AF CIRCUIT (MAIN UNIT)

The AF circuit de-emphasizes the demodulated signal with -6 dB/octave and power-amplifies the AF signal to drive a speaker. The AF circuit includes an AF mute circuit for the squelch.

The AF signal output from IC102 (pin 9) passes through a de-emphasis circuit (R157, C151) and is then amplified at Q118. This de-emphasis circuit is an integrated circuit with frequency characteristics of -6 dB/octave.

The amplified signal is applied to the AF mute circuit (Q120). When the squelch is closed, Q120 cuts off the AF signal as an AF mute switch. The AF signal is applied to the [PWR/VOL] control (R169) and is then power-amplified at the AF power amplifier (IC103) to drive a speaker.

4-1-6 SQUELCH CIRCUIT (MAIN AND LOGIC-A UNITS)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signals from IC102 (pin 9) pass through the [SQL] control and are then applied to an active filter circuit (IC101B, pin 2). The active filter circuit amplifies the noise components of frequency 20 kHz and above.

The noise signals from IC101B (pin 1) are rectified by D110 and are then converted to DC voltage at R164, R165, C158 and C159. The DC voltage triggers the squelch control switch (Q119).

An "SQL" signal from Q119 is applied to the CPU (IC701, pin 15) on the LOGIC unit. When the CPU (IC701, pin 15) receives the "SQL" signal, the CPU (IC701, pin 30) outputs an "RMUT" voltage. The "RMUT" signal cuts the AF signal using the AF mute circuit (Q120).

4-1-7 5-TONE DECODER CIRCUIT (LOGIC-A UNIT)

A portion of the AF signals from the FM IF IC (IC102) in the MAIN unit are applied to the self-correlator (IC706). The self-correlator picks up only audio components in the AF signals and then applies them to the 5-Tone encoder/decoder IC (IC705).

The 5-Tone encoder/decoder IC decodes the correlated signals to 5-Tone data and applies them to the CPU (IC701). Once the 5-tone data are decoded, 5-Tone mute signals are released and the AF mute circuit (Q120) in the MAIN unit functions as a noise squelch only.

• AF CIRCUIT

Fig. 2

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (MAIN UNIT)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed for the modulation circuit.

The AF signals from the built-in condenser microphone or from the [EXT MIC] jack are applied to the limiter amplifier circuit (Q101~Q104). This circuit is a negative feedback circuit with +6 dB/octave pre-emphasis characteristics in the 300 Hz~3 kHz range. The output signals from the limiter amplifier pass through a splatter filter circuit (IC101A) which eliminates signal components greater than 3 kHz. Pin 7 of IC101A outputs a "MOD" signal. The "MOD" signal is applied to the modulation circuit on the PLL unit.

4-2-2 MODULATION CIRCUIT (PLL UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The "MOD" signal changes the reactance of a varactor diode (D212) to modulate the oscillated signal at the VCO circuit (Q205, L211, D213, D214). The oscillated signal is buffer-amplified at Q206.

The buffer-amplified signal passes through the transmit/receive switching circuit (D216) and is then applied to the drive amplifier circuit.

4-2-3 DRIVE AMPLIFIER CIRCUIT (PLL UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal to the needed level at the power amplifier.

The signal from the transmit/receive switching circuit (D216) is amplified at the pre-drive amplifier (Q208) and is then re-amplified at a drive amplifier (Q209) to obtain 20 mW.

The control voltage from the APC circuit is applied to the collector of Q209 for stable RF output power from a power amplifier (IC201).

4-2-4 RF POWER AMPLIFIER (PLL UNIT)

IC201 is a power module which provides a stable 5 W (at DC 13.2 V) of output power.

The RF signal from the drive amplifier (Q209) is applied to the power amplifier (IC201, pin 1). The amplified signal is output from IC201 (pin 5). The output signal is applied to the antenna connector through the APC detector circuit, antenna switching circuit and low-pass filter circuit.

4-2-5 APC CIRCUIT (PLL UNIT)

The APC circuit protects the power module (IC201) from a mismatched output load and selects HIGH or LOW output power.

The output power from the power module (IC201, pin 5) passes through the APC detector circuit (L218, D217, D218) where the forward and reflection components are detected as an APC voltage. When the antenna impedance is matched at 50 Ω , the detected voltage is at its minimum. However, when antenna impedance is mismatched, the detected voltage is higher than when it is matched.

The detected voltage is applied to a differential amplifier circuit (Q217, Q218). The APC reference voltage is determined by the power output control circuit (R270~R274) and is then applied to the base of Q217.

When the antenna impedance is mismatched, the base voltage of Q218 exceeds the reference voltage. The collector voltage of Q218 decreases.

The current from the differential amplifier circuit (Q217, Q218) is amplified at Q216 to control Q215 and Q221. The control voltage changes the supply voltage to IC201 and Q209. This decreases the output power from the drive amplifier (Q209) and power module (IC201) until the base voltage of Q218 reaches the same level as the voltage of Q217.

4-2-6 POWER OUTPUT CONTROL CIRCUIT (PLL UNIT)

The power output control circuit (R270~R274) selects "HIGH" or "LOW" output power levels and controls the RF output power with the APC reference voltage.

When "HIGH" output power is selected, the APC reference voltage is determined by R270, R271 and R274. The RF output power is adjusted with R270.

When "LOW" output power is selected, the APC reference voltage is determined by R270~R274. The RF output power is adjusted with R273.

4-2-7 TX MUTE CIRCUIT (PLL UNIT)

The TX mute circuit interrupts the transmission by controlling the TMUTE signal.

When a "TMUT" signal from the CPU (IC701, pin 31) on the LOGIC unit turns Q207 OFF to interrupt the transmission, the bias voltages are prevented from entering Q208, Q209 and IC201.

4-2-8 ANTENNA SWITCHING CIRCUIT (PLL UNIT)

The antenna switching circuit applies the received signal to the receiver circuit and the transmitter signal to the antenna connector.

When transmitting, D218 and D220 are turned ON. The RF output signal is not permitted to enter the receiver circuit. The signal passes through D218 and the low-pass filter (L221, L222, C262~C266). The filtered signal is applied to the antenna connector. The low-pass filter suppresses high harmonic components.

4-3 PLL CIRCUITS

4-3-1 GENERAL

PLL circuits provide steady oscillation of the transmit frequency and the receive 1st LO frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

4-3-2 PLL CIRCUIT (PLL UNIT)

The PLL circuit, using a PLL IC (IC202) and a prescaler (IC203), directly generates the transmit frequency and the receive 1st LO frequency with the VCO (Q205, L211, D213, D214). Signals from the VCO are prescaled at the prescaler (IC203) based on N-data from the PLL IC (IC202, pin 5). The resulting signal is applied to the PLL IC (IC202, pin 4). The PLL IC (IC202) detects the out-of-step phase and outputs it from pins 12 and 13.

4-3-3 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)

A 5.12 MHz (wide type) or a 6.4 MHz (narrow type) reference frequency is produced by Q214 and X201. The frequency is adjusted with C292. D223, R261 and R265 compensate for temperature to maintain frequency stability within ± 5 ppm ($-25^{\circ}\text{C} \sim +60^{\circ}\text{C}$; $-13^{\circ}\text{F} \sim +140^{\circ}\text{F}$). The reference frequency is applied to the PLL IC (IC202, pin 17).

4-3-4 VCO CIRCUIT (PLL UNIT)

The VCO circuit (Q205, L211, D213, D214) generates the transmit frequency and the receive 1st LO frequency. The varactor diodes (D213, D214) provide frequency control.

In receive mode, Q204 and D212 are turned ON as the "RS5" voltage line becomes 5 V. C234 is connected to D213 and D214 in parallel. Therefore, the VCO output frequency is shifted to a lower frequency than while transmitting.

In transmit mode, Q204 and D212 are turned OFF as the "RS5" voltage line becomes 0 V. C234 is disconnected from the resonant circuit. Therefore, the VCO output frequency is shifted to a higher frequency than while receiving.

The output signal from the VCO circuit is applied to a buffer amplifier (Q206) which amplifies VCO oscillation and does not permit the latter circuit to affect the VCO oscillation.

• PLL CIRCUIT

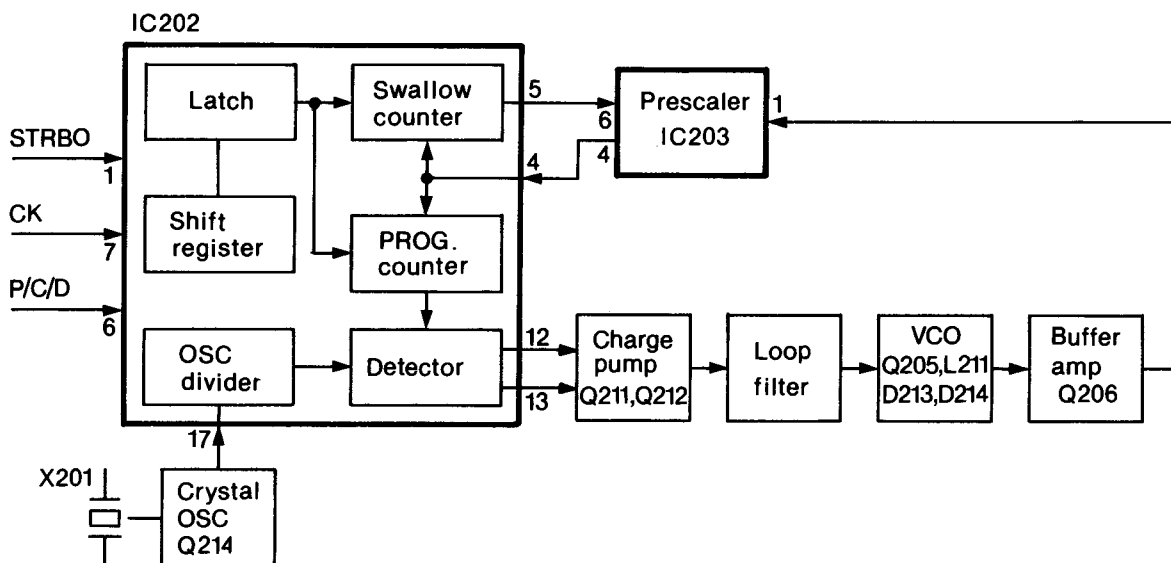

Fig. 3

4-3-5 PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (PLL UNIT)

The programmable divider shifts the dividing ratio, depending on the operating frequency, with a prescaler and determines the VCO oscillating frequency. The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

IC202 is a PLL IC that contains a pulse counter, a programmable divider and a phase detector. IC202 accepts up to 14 MHz inputs. The input signal from the prescaler (IC203, pin 4) passes through the programmable counter section of IC202.

A 5.12 MHz (wide type) or a 6.4 MHz (narrow type) reference frequency from X201 is applied to IC202 (pin 17) and passes through a programmable reference counter section of IC202. Both of the divided signals are compared at a phase detector section of IC202. The phase-detected signal (pulse signal) is output from IC202 (pins 12 and 13).

4-3-6 LOOP FILTER CIRCUIT (PLL UNIT)

The phase-detected signal (pulse signal) from IC202 (pins 12 and 13) passes through the charge pump (Q211, Q212) and is then applied to a lag-lead loop filter (R244, R245, C277). The pulse signal is converted to DC voltage (PLL voltage) to control the oscillation from the VCO circuit.

The charge pump (Q211, Q212) is used to expand the range of the PLL lock voltage. The PLL lock voltage changes the reactance of varactor diodes (D213, D214).

4-3-7 UNLOCK SENSOR CIRCUIT (MAIN AND PLL UNITS)

When the PLL circuit is unlocked, IC202 (pin 10) becomes "LOW." The "LOW" signal passes through the unlock sensor circuit (Q124, Q125) and is then applied to the CPU (IC701, pin 16) as an unlock signal.

4-4 POWER SUPPLY CIRCUITS

4-4-1 VOLTAGE LINES

LINE	DESCRIPTION
EXT	The external DC power from the DC power connector (J204).
VCC	This voltage passes through a power switch (R169) and is then applied to the 5 V regulator circuit. This voltage line changes depending on the battery pack type: 8.4 V (CM-8B, CM-96B), 13.2 V (CM-7B).
+5 V	Common 5 V converted from the VCC line at the 5 V regulator circuit (Q116, Q117, D107, D108). This regulator circuit is composed of a complementary connection to ensure high current amplification and supplies stable output voltage continuously with good temperature characteristics in all modes.
+5	5 V controlled by the power saver function. When the power save is turned ON, a "PSAV" signal from the CPU (IC701, pin 29) interrupts the "+5" line intermittently to save power. This voltage is converted from the VCC line at Q114, Q115 and D106. This regulator circuit forms a complementary circuit.
R5	Receive 5 V controlled by a "T/R" signal from the CPU (IC701, pin 39). This voltage is converted from the VCC line at Q112, Q113 and D105. This regulator circuit forms a complementary circuit.
T5	Transmit 5 V controlled by a "T/R" signal from the CPU (IC701, pin 39). This voltage is converted from the VCC line at Q112, Q113 and D105. This regulator circuit forms a complementary circuit.

4-4-2 CPU POWER SUPPLY CIRCUIT (MAIN AND LOGIC-A UNITS)

The DC voltage is applied to the 16k CMOS RAM (IC703, pin 24) via D102 from the lithium backup battery (BT101) to provide backup for the memory contents regardless of the power switch supply.

• CPU POWER SUPPLY CIRCUIT

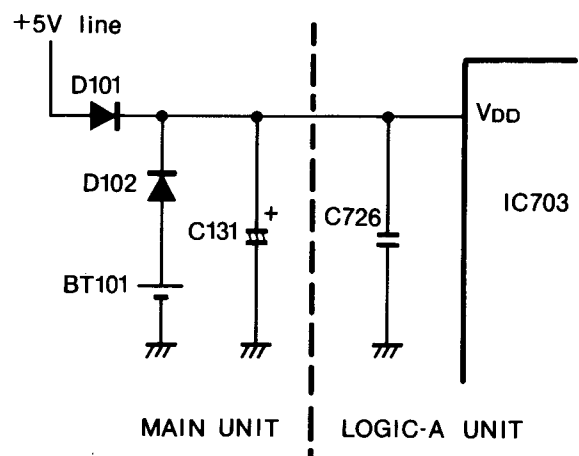

Fig. 4

4-5 LOGIC CIRCUITS

4-5-1 GENERAL

Logic circuits consist of an 8-bit CPU, a CMOS EPROM, a 16k CMOS RAM a 5-Tone encoder/decode and a subaudible tone encoder. The circuit controls frequency, tone setting, FUNCTION DISPLAY and more.

4-5-2 PORT ALLOCATIONS

IC701 CPU (LOGIC-A UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
DB0~DB7	5~2, 64~61	These are 8-bit data busses for an external ROM and RAM. DB0~DB3 are also used as matrix input ports.
PE0~PE15	43~57, 59	These are 16-bit data busses. PE0~PE7 are used as matrix output ports. PE13~PE15 are used as matrix select signal ports for the RAM.
PA7 [CS]	34	This port becomes "LOW" when IC701 outputs command or data signals to IC601.
PA6 [P/C/D]	33	Outputs a selector signal for selecting the signal of PLL N-data and IC601 command/data.
PA5 [CK]	32	Outputs a synchronizing signal when the PLL N-data is output.
PA4 [TMUT]	31	Outputs a transmit mute signal. "HIGH": transmit mute.
PA3 [RMUT]	30	Outputs a receive mute signal. "HIGH": receive mute.
PA2 [PSAV]	29	Outputs a power save control signal.
PA1 [CPO]	28	Outputs cloning data.
PA0 [STRB0]	27	Outputs a strobe signal for PLL data.
PB6 [STRB2]	41	Outputs a strobe signal for the CTCSS data.
PB5 [STRB1]	40	Outputs a strobe signal for the 5-Tone encoder.
PB4 [T/R]	39	Outputs the transmit/receive switching signal. "HIGH": transmit "LOW": receive
PB0~PB3 [S0~S3]	38, 35, 36, 37	Input/output ports for 5-Tone data.

PORT NAME	PIN NUMBER	DESCRIPTION
PC5 [BUSY]	11	Outputs the BUSY signal for IC601.
PC4 [FUNC]	12	Input port for the [FUNCTION] switch. The transceiver enters the cloning receive mode when the port is "LOW" at turning the power ON.
PC3 [TRF]	13	Input port for the TRANSMIT indicator. "LOW": indicates.
PC2 [SEND]	14	Input port for the transmit/receive switching signal. The port is also used as the cloning input.
PC1 [SQL]	15	Input port for the squelch open/close. "HIGH": squelch opens.
PC0 [UNLK]	16	Input port for the PLL unlock signal. "LOW": PLL unlocked.
SO	21	Outputs serial data.
SCK	19	Outputs a data timing signal synchronized with the SO port.
INT0	7	Input port for a strobe signal from the 5-Tone decoder IC. Readies the CPU to read the 5-Tone data.
INT1	6	IC701 enters the stand-by mode when the port becomes "HIGH." This port becomes "HIGH" and "LOW" when the power is turned OFF and ON respectively.
TO	18	Outputs beep signals.
WR	9	Outputs the write signal to the external RAM (IC703). "LOW": data are stored into RAM.
RD	10	Outputs the read signal to the external ROM and RAM. "LOW": data are recalled from the ROM or RAM.
φout	60	Outputs clock signals for controlling 5-Tone signals. The output frequency is 560 kHz.

4-6 5-TONE CIRCUITS

4-6-1 5-TONE IC (LOGIC-A UNIT)

IC705* is a gate-array IC consisting of a 5-tone encoder/decoder, a data selector for controlling the CPU, a serial-parallel converter and divider and an inverter for resetting. The following I/O ports are equipped.

*IC705

SC1093 for #33, #41, #43~#45.

SC1084 for #34, #36~#40, #42, #46~#49.

PORT NAME	PIN NUMBER	DESCRIPTION
IO0~IO3	64~61	These are input/output ports for the 5-Tone encoder/decoder.
CON1	60	Input port for selecting IO0~IO3 condition. "LOW": output ports "HIGH": input ports
RX	59	Input port for selecting IC705 function. "LOW": encoder "HIGH": decoder
TO1, TO2	44, 45	Input ports for 5-Tone format selection.
ST1	57	Input port for 5-Tone encoder/decoder strobe signal.
EC0~EC2	41~43	Outputs the 5-Tone encoder data.
DS	21	Input port for audio signals.
ST3	8	Outputs a strobe signal for the 5-Tone decoder.
SE1~SE3	2~4	Input ports for a data selector.
MA0~MA3, DB0~DB3, CE1	39~36, 55~52, 51	Function of each port CE1 and DB0~DB3 is determined by data from ports SE1~SE3. Ports MA0~MA3 are allocated as data input.
ST2, SCK2, SI2	56, 6, 7	These are serial input ports for converting data from serial to parallel.
P1~P7	13~19	Outputs the parallel signal to the subaudible tone encoder (IC704).
IN1, IN2	9, 11	These ports are connected to internal inverter input.
OUT1, OUT2	10, 12	These ports are connected to internal inverter output.
KO1	5	Outputs 4.48 MHz signals.
KO3	22	Outputs 560 kHz signals.
OSC1, OSC2	34, 35	Ports for a crystal oscillator.

The 5-Tone system depends on the transceiver version and combination of the ports TO1 and TO2 as follows:
(Refer to Section 8-4)

TO1	TO2	#33, #41, #43~#45	#34, #36~#40, #42, #46~#49

4-6-3 D/A CONVERTER CIRCUIT (LOGIC-A UNIT)

EC0~EC2 of IC701 outputs 5-Tone signals digitally. R713~R718 convert signals from digital to analog, and then output the signals as 5-Tones to the MAIN unit.

4-7 OTHER CIRCUITS

4-7-1 DC-DC CONVERTER CIRCUIT (PLL UNIT)

A DC-DC converter (Q213) and L223 form a blocking oscillator circuit which supplies a stable output voltage to the charge pump (Q211, Q212). The DC voltage is used to obtain wide range lock voltage for the PLL circuits.

4-7-2 DISPLAY CIRCUIT (DISPLAY UNIT)

IC601 is a programmable LCD controller/driver IC chip. Data from the LOGIC-A unit are applied to IC601 and divided by 3 to be indicated on the function display.

SECTION 7 ADJUSTMENT PROCEDURES

7-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.2 V DC Current capacity : 3 A or more	Audio generator	Frequency range : 300~3000 Hz Output level : 1~200 mV
RF power meter (terminated type)	Measuring range : 1~10 W Frequency range : 120~180 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Attenuator	Power attenuation : 40 or 50 dB Capacity : 10 W or more
Frequency counter	Frequency range : 0.1~180 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	AC millivoltmeter	Measuring range : 2~200 mV
		Non-inductive resistor	Impedance : 8 Ω
Distortion meter	Frequency range : 1 kHz±10 Hz Measuring range : 1~100 %	DC volteter	Input impedance : 50 kΩ/DC or better
		FM deviation meter	Frequency minimum : 180 MHz Measuring range : 0~±5 kHz
Standard signal generator (SSG)	Frequency range : 0.1~180 MHz Output level : -127~-17 dBm (0.1 μV~32 mV)	Digital multimeter or oscilloscope	Input impedance : 1 MΩ/DC or better

■ CONNECTION

7-2 PLL ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1 <ul style="list-style-type: none"> • Operating frequency: 173.900 MHz • Receiving 	PLL	Connect the digital multimeter or oscilloscope to R246.	15.0 V	PLL	L211
	2 <ul style="list-style-type: none"> • Transmitting 			Less than 16.0 V		Verify
	3 <ul style="list-style-type: none"> • Operating frequency: 146.000 MHz • Receiving 			Higher than 3.8 V		Verify
REFERENCE FREQUENCY	1 <ul style="list-style-type: none"> • Operating frequency: 146.000 MHz • Connect the RF power meter or a 50 Ω dummy load to the antenna connector. • Transmitting 	Top panel	Loosely couple the frequency counter to the antenna connector.	146.000 MHz	PLL	C292

• PLL UNIT

7-3 RECEIVER ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
SENSITIVITY	<p>CAUTION: This transceiver automatically transmits an answer back code when a 5-tone code is received. Be careful when connecting the SSG to the antenna connector.</p>					
	1	<ul style="list-style-type: none"> Operating frequency: Center of the frequency range. Connect the SSG to the antenna connector and set as: <ul style="list-style-type: none"> Level : 0.35 μV* (-116 dBm) Modulation: 1 kHz Deviation : \pm3.5 kHz <ul style="list-style-type: none"> (#34, #37, #38, #41, #45, #46, #47) \pm2.4 kHz (#42) \pm1.75 kHz (#33, #36, #39, #40, #43, #44, #48, #49) Receiving 	Top panel	Connect the distortion meter to the [EXT SP] jack with an 8 Ω load.	Minimum distortion level	PLL
SQUELCH SENSITIVITY	1	<ul style="list-style-type: none"> Select any channel. Apply no signal to the antenna connector. Receiving 	Front panel	Speaker	Squelch threshold point is between the 9 o'clock and 12 o'clock positions.	Verify

* This output level of the standard signal generator (SSG) is indicated as the SSG's open circuit.
