

**SERVICE MANUAL  
FOR  
BSR230 SERIES**

**NOKIA**

### 3. SPECIFICATION

#### 3-1 General

Mode of operation	:	Duplex system with two antennas
Frequency range	:	VHF Version A 136-155MHz Version B 146-174MHz Version D 224-235MHz
		VHF Version C 400-440MHz Version D 440-470MHz
		Version E 470-512MHz Version F 480-520MHz
Number of channels	:	Up to 128 synthesis programmed channels
Switchable channel bandwidth	:	3MHz
Channel spacing	:	Narrow-band 12.5kHz Wide-band 20, 25 or 30kHz
Duplex TX/RX frequency separation	:	0.5MHz minimum
Duty cycle	:	Tx : Rx : WAIT 1min : 3min : 5 min
Antenna impedance	:	50 ohms
Environmental conditions	:	Ambient temperature -30°C to +60°C Relative humidity 95% at +35°C
Dimensions and weight	:	Transceiver Unit 462 mm width 151 mm height 350 mm depth 10 kg

3-2 Transmitter

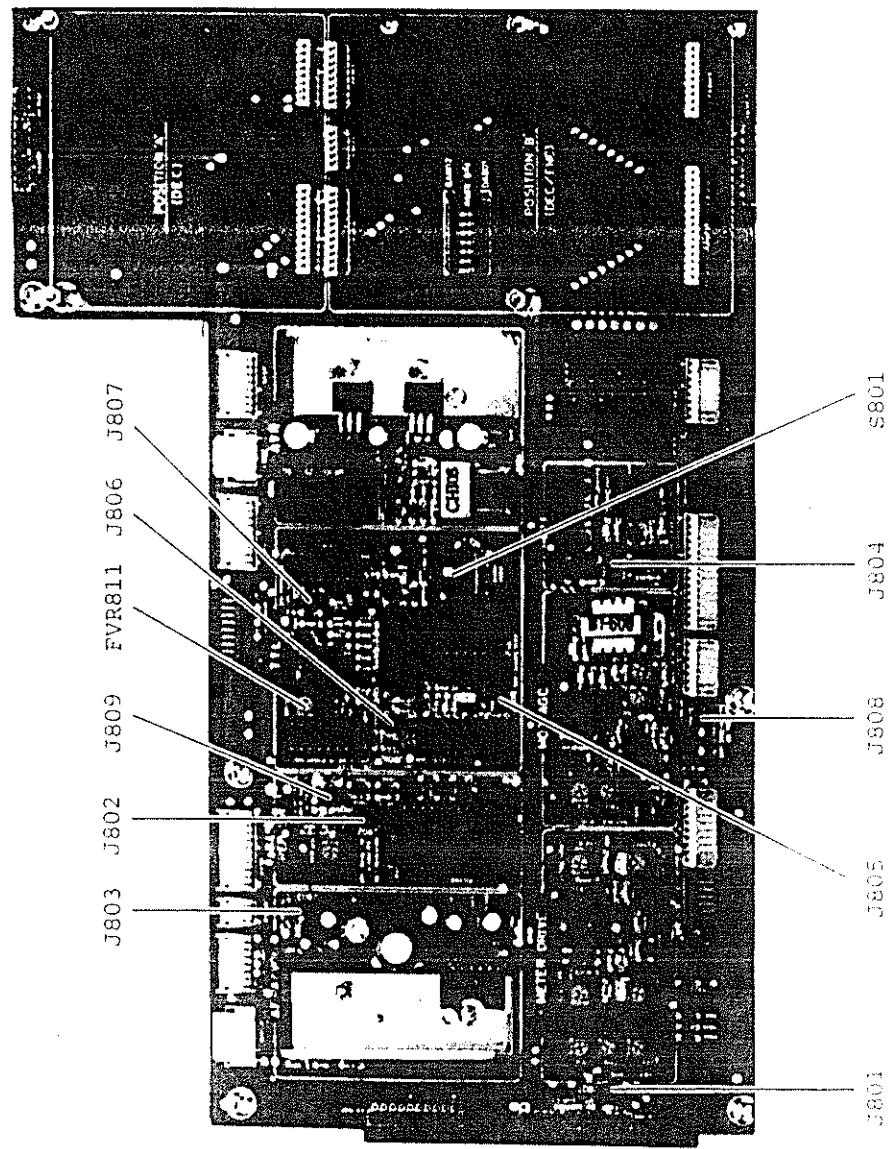

RF power output	:	25-50 watts (standard)
Maximum frequency deviation	:	Narrow-band $\pm 2.5\text{kHz}$
	:	Wide-band $\pm 5\text{kHz}$
Oscillation system	:	Direct PLL synthesizer system
Type of crystal unit	:	TCXO
Frequency stability	:	$\pm 2.5\text{kHz}$ with wide band, $\pm 1\text{kHz}$ with narrow band.
Frequency response	:	Within $+1, -3\text{dB}$ of $6\text{dB/octave}$ pre-emphasis from $0.3$ to $3\text{kHz}$ , $1\text{kHz}$ reference
Signal to noise ratio	:	More than $50\text{dB}$ at $1\text{kHz}$ $70\%$ modulation
Modulation distortion	:	Less than $3\%$ at $1\text{kHz}$ $70\%$ modulation
Spurious and harmonics	:	More than $70\text{dB}$ down below rated power
AF input	:	$-8\text{dBm} \pm 3\text{dB}/600 \text{ ohms}$

3-3 Receiver

Receiving system	:	Double conversion superheterodyne
Intermediate frequency	:	1st IF $21.6\text{MHz}$
	:	2nd IF $455\text{kHz}$
Frequency stability	:	$\pm 2.5\text{kHz}$ with wide band, $\pm 1\text{kHz}$ with narrow band..
Sensitivity	:	Less than $1\mu\text{V}$ emf. for $20\text{dB}$ noise quieting Less than $0.70\mu\text{V}$ for $12\text{dB}$ SINAD
Squelch sensitivity	:	Less than $0.50\mu\text{V}$
Modulation acceptance	:	$\pm 7.0\text{kHz}$ for wide band, $3.5\text{kHz}$ for narrow band.
Selectivity	:	More than $70\text{dB}$ at $25\text{kHz}$ point, $60\text{dB}$ at $12.5\text{kHz}$ point.
Blocking	:	More than $90\text{dB}$ at $\pm 1\text{MHz}$ point
Intermodulation	:	More than $70\text{dB}$
Spurious responses	:	More than $80\text{dB}$ <sup>4</sup>

AF response	:	Within +1, -3dB of 6dB/octave de-emphasis from 0.3 to 3kHz, 1kHz reference
AF output	:	More than 2 watts into 4 ohm load for local control 0dBm ±3dB for remote control
AF distortion	:	Less than 5% at 1kHz 70% modulation
Signal to noise ratio	:	More than 50dB at 1kHz 70% modulation
<b>3-4 Power Supply</b>		
Power source	:	13.6V DC ±20% negative ground.
Power consumption	:	<u>Operation</u> <u>DC</u>
		Standby      0.7A
		Receiving      1A
		Transmitting
		at 5W      2.5A
		at 10W      3.5A
		at 25W      6A
		at 50W      12A

4. Jumpering Positions on Terminal Unit PCB

a) J801 AUD10 CUT-OFF

To decide whether receiver output is cut-off or kept alive in transmitting periods.

ON : Audio CUT-OFF in TX period. (Simplex base station)

OFF : Audio kept alive in TX period. (Duplex base or repeater station)

b) J802 BASE/REPEATER CONTROL

To control Base/Repeater mode control relay. With jumper ON, relay operates to become Repeater mode. Jumper should remain uninserted to operate the Base/Repeater function externally.

In repeater mode, the following functions become effective:

- Press control function due to SQL OUT.
- "REPEATER" INDICATOR glows.
- Transfer of receiver output (0dBm) to repeating modulation.
- Transfer of the Variable Squelch Circuit to the internal semi-fixed setting.
- Function of the Press Delay Circuit becomes effective.

c) J803 SP ON/OFF

To turn ON/OFF SP within BRS. Set to SP ON usually.

ON : SP ON

OFF : SP OFF

d) J804 HPF

Where BRS mounts Tone Squelch PCB, 10-QCT(A), or Tone Panel, this HPF jumper is to eliminate DISC output tone component.

A-side : When 10-QCT(A) or Tone Panel is mounted.

B-side : When no Tone Squelch PCB is mounted (THROUGH).

e) J805 TTL TIME STEP

This jumper is to arrange the step time setting when KG110 is operated by the TTL (Transmitter Time Limiter) circuit.

ON : 1 STEP = 30 seconds

OFF : 1 STEP = 15 seconds

Incidentally, TTL steps can freely be varied in sixteen (0 to 9 plus A to F) steps with DIP SW, S801. In other words,  $30 \times 15 = 450$  seconds max. (7 min. 30 sec.) for J805 "ON".  $15 \times 15 = 225$  seconds (3 min. 45 sec.) for J805 "OFF". At step "0", TTL time becomes "0"- i.e., "no TTL".

f) J806 TTL MODE

This jumper is to select either of the two alternatives:

Whether one press-to-talk time, for instance, should be taken as TTL TIME or one conversation time should be taken as TTL TIME.

The latter case is effective only when 10-5T(D) 5-TONE DECODER for Repeater Press Key is installed in KG110.

ON : 1 STEP TTL MODE

OFF : INTEGRATION TTL MODE

g) J807 PRESS DELAY CONTROL

This jumper is to hold (or extend) a transmission time interval by an optionally preset time at the termination of conversation in repeating periods.

ON : PRESS DELAY

OFF : NO DELAY

In case of "ON", the time can be set to 20 seconds, max., with FVR811 (without steps). (Usually set to 9 ±1 seconds before shipment.)

h) J808 PRESS SW CONTROL

To prevent all transmitting functions from being controlled by the microphone press-to-talk signal, when a particular TTL mode is set with PCB (option) or a function such as 10-5T(A) Encoder/Decoder having a call signal is provided.

ON : Mic press-to-talk SW only is effective (no other options)

OFF : 10-5T(A) or special TTL is installed.

i) J809 JUMPER FOR COMMUNITY REPEATER OPERATION

Where BSR operates as a community repeater with the addition of Tone Panel (option), this jumper is to prevent BSR from becoming TX mode merely because of signal reception. The microphone press-to-talk function works irrespective of this jumpering.

ON : When operated as a normal repeater (i.e., without Tone Panel), or, when operated with 10-QCT(D)/10-5T(D).

OFF : When Tone Panel is used for Community Repeater.

JUMPERING CHART FOR TYPICAL SYSTEM CONFIGURATIONS

Duplex Base Station Mode	Repeater Station Mode	Base & Repeater Station Mode	Simplex Base Station Mode			Mode					
			1	0	1	1	0	1	1	10-5T (A)

LEGEND:

A : Standard function  
needs modification.

0 : Standard function.

\*1 : Belongs to 110-5T.

\*2 : OFF when Power Supply is connected to Community Repeater.

## 5. CIRCUIT DESCRIPTION

### 5-1 PLL Section

The 12.00MHz output frequency from the RX-UNIT-mounted reference oscillator (TCXO) is divided into 1:16 to obtain the 750kHz strobe signal to become the reference frequency division input and the frequency division data input to the PLL IC (MC145146).

In order to share the reference frequency between TX and RX, the 750kHz strobe signal is received from RX UNIT with the TX UNIT.

The 750kHz strobe signal is counted up by IC and its data output becomes the data latch address signals for the EP-ROM and PLL IC.

The PLL IC (MC145146) needs 29-bit data for one frequency. The data is divided into eight sets each of 4 bits and they are applied in parallel to the PLL IC.

Therefore, the frequency-determining data are input in eight addresses for each RX channel or TX channel as regards the addresses of the EP-ROM.

Since the one-address data is input to the PLL IC as short a time interval as 1/750kHz, data recognition for the input of one frequency data is accomplished within as brief a time as  $1 \times 8/750\text{kHz}$ .

Furthermore, since the data is being refreshed at all times, the data can easily be altered with the same timing, even when the channel is changed.

Also, since the transmit and receive data are written into separate EP-ROMs, write-in operation, or programming, is feasible, even if the transmit and receive frequencies are different from each other.

Since the reference frequency division ratio can also be designated by ROM, division ratios ranging 3 to 4,096 of 750kHz are theoretically feasible. Be sure to adopt either 6.25kHz, 10kHz or 12.5kHz as the reference.

The RF signal from VCO is frequency-divided into 1:64 before application to PLL IC and further, undergoes frequency division according to the ROM data and phase comparison with the reference frequency.

The phase difference signal passes through the low-pass filter to become a DC voltage to control the oscillation frequency of VCO.

#### 5-2 VCO Section

This section incorporates oscillation circuits independently incorporated in TX and RX units. Whereas Q201 (RX VCO) is for use with RX 1st local oscillator (LO) (F=21.6MHz), Q401 (TX VCO) is to initiate oscillations at the transmit frequency.

These two VCOs when used for a simplex base station are switched over by means of a press-to-talk switch, but they operate simultaneously when used for a duplex base station.

Control for either alternative is enabled by Jumper J801 in the terminal board.

Either oscillator output is amplified by the buffer amplifier IC "PC1651 to become the input signal to amplifier Transistor 2SC2753 and a part of the prescaler IC μPB571C. The RX LO signal is amplified by Q202 to cause the 1st mixer DBM-1 to drive.

The transmit signal is amplified by Q402 and the amplified signal becomes the input signal to the TX section. The PLL circuit when unlocked causes Q203 and Q204 in case of RX section or Q403, Q404 in case of TX Section to operate, thereby turning "OFF" the TX output.

### 5-3 RX Section

The RF input signal incoming from the antenna passes through the bandpass filter (BPF-1) in succession to undergo amplification by Q1. The amplified signal passes through the bandpass filter (BPF-2) to be applied as the input to the DBM-1 (diode, double-balanced mixer).

The DBM-1 is to mix the amplified RF signal with the 1st local oscillator (LO) signal to develop the 1st IF signal at 21.6MHz as its mixed output.

The output signal is further amplified by Q102, followed by still further amplification by Q103 after the initially amplified signal being applied to the crystal filter (XF101). The finally amplified signal is applied to IC107 as its input. At IC107, the 1st IF signal at 21.6MHz is converted into 455kHz through the 2nd mixer. The 455kHz signal passes through the 455kHz ceramic filter (CF101) to obtain an AF signal via the limiting amplifier and discriminating circuit.

The AF signal is then separated into the audio signal and the noise signal necessary for squelch control.

The audio signal passes through the lowpass filter IC108 (1/2), the delay circuit consisting of Q106, Q107, and IC109, the lowpass filter Q108, and the highpass filter of IC110 (1/2), the integrating circuit of IC110 (1/2), and the squelch gate circuit Q111 in succession to undergo 0dBm power amplification by IC111. The BTL 0dBm signal is applied to the Final Power Amp TA7252.

The squelch noise signal undergoes amplification by IC107 and IC108 (1/2) and detection by DC, to become a DC signal.

The DC signal passes through the switching circuit consisting of IC107 and Q104 to obtain the SQL OUT signal.

#### 5-4 TX Section

The RF signal from VCO is amplified by Transistors Q301, Q302 to serve as power for driving the RF power amplifier module. The amplified RF signal, on the other hand, becomes a signal for driving the DRIVE meter. The signal amplified by the module is further amplified by the final-stage RF power amplifier consisting of the stripline to become the RF power output ranging from 50W to 60W.

The output is radiated from the antenna via the low-pass filter and combining network.

Part of the module output undergoes detection and DC amplification for feeding back to the 1-stage amplifier to become a control signal for the output power.

Even if the antenna is mismatched, reflected waves can be detected, causing the module input power to decrease and the module to be protected from damage.

The transceiver unit is equipped with a heatsink for sufficiently dissipate generated heat. This enables a consecutive 24-hour transmission capability.

The detected control signal is amplified to become a power alarm and a SWR alarm. The power alarm operates on reaching one-half the rated power, while the SWR alarm operates when the ANTENNA is open or shorted. No sooner than the two alarms work, LED (D606) glows "red".

#### 5-5 Modulator Section

An audio signal produced by a human voice radiated to the MIC undergoes amplification by the ALC (Automatic Level Control) amplifier IC I803 (M51304) and IC804 (NJM4556).

Standard input level to the MIC is rated at 1kHz, -34dBm, while that in case of remote control is rated at 1kHz, -8dBm.

The amplified audio signal passes through the preemphasis circuit consisting of C356 and R346 before it is amplitude-limited by the limiting amplifier IC309 (1/2). The amplitude-limited signal passes through the lowpass filter consisting of L310 and L311 to become a modulating signal to be applied to the gate of TX VCO FET (Q401).

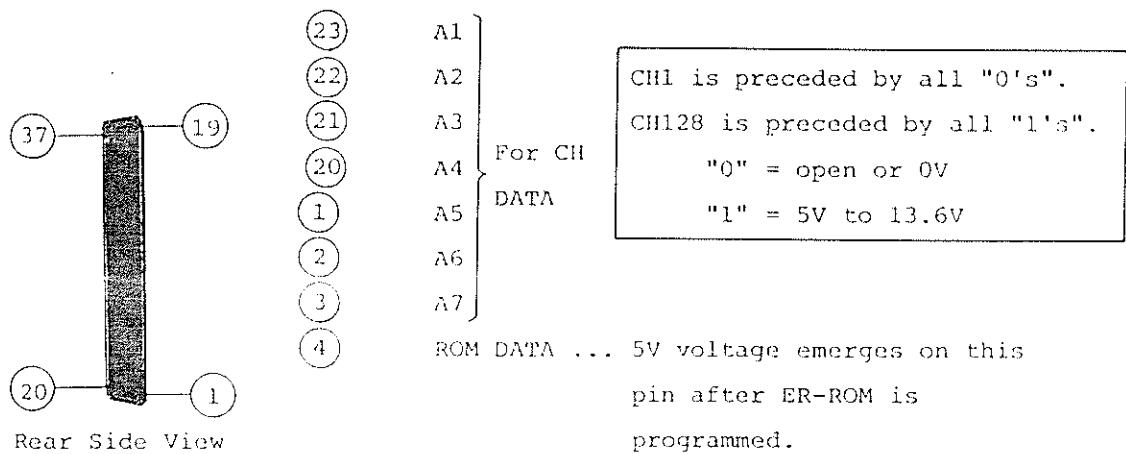

## 5-6 Description of Remote Control

### 5-6-1 37-Pin D-SUB Connector for Remote Control

Provided on the rear panel of BSR radio, the 37-PIN D-SUB CONNECTOR has 37 pins whose functions are as follows:

(36) (37) 13.6V DC

(18) , (19) , (7) GND

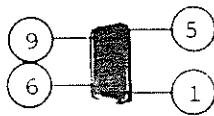

- (8) REMOTE ... When controlled externally from line interface unit. This PIN is grounded. When this signal is grounded, all of POW SW, SQL CONTROL, and CH can only be controlled from remote control side
- (9) BUSY ... 8V voltage emerges on this pin during receive period. 0V emerges when BSR is in standby status.
- (10) VOL (-) ... Volume control common.
- (11) VOL ... For volume control use. Use type 10K-B Volume.
- (12) SQL ... For SQL control use. Use type 10K-B Volume
- (13), (14) AF OUT ... To obtain RX 0dBm output. A -6dBm output is available between either 13 or 14 pin and GND.
- (15) PRESS ... When grounded, BSR radio operates in TX mode.
- (16) SP ... An AF output of either 4W/4Ω or 2W/8Ω at max. is available.
- (24), (25), (26) ... No connection.

- (31) AUX 1 ... No connection.
- (32) TX ALARM ... This signal is used as a TX alarm. The TX alarm signal voltage ranges from 5 to 6 volts when TX power is reduced to one-half or ANTENNA is open or shorted.
- (33), (34) MODULATION INPUT ... Standard modulation input is 1kHz, -8dBm.
- (35) POW SWITCH ... To operate POW SWITCH on a REMOTE CONTROL basis. When grounded, BSR power switch turns "ON".

Note: All other pins are not used in BSR.

### 5-6-2 9-Pin D-SUB Connector for Tone Panel

Provided on the rear panel of KG110, the 9-Pin D-SUB Connector has nine pins whose functions are as follows:

Rear Side View

- (1) +13.6V DC is available.
- (2) No connection.
- (3) Not used.
- (4) No connection.
- (5) PRESS ... When grounded, BSR is placed in TX mode.
- (6) No connection.
- (7) } GND
- (8)
- (9) Not used.

## 6. MAINTENANCE INSTRUCTIONS

### 6-1 General

The Base Station Radio, BSR has been designed to ensure a high degree of reliability over a long trouble-free service life without maintenance efforts.

However, occasional inspections and adjustments are required to maintain the radio in the optimal conditions.

### 6-2 Necessary Tools and Measuring Equipment

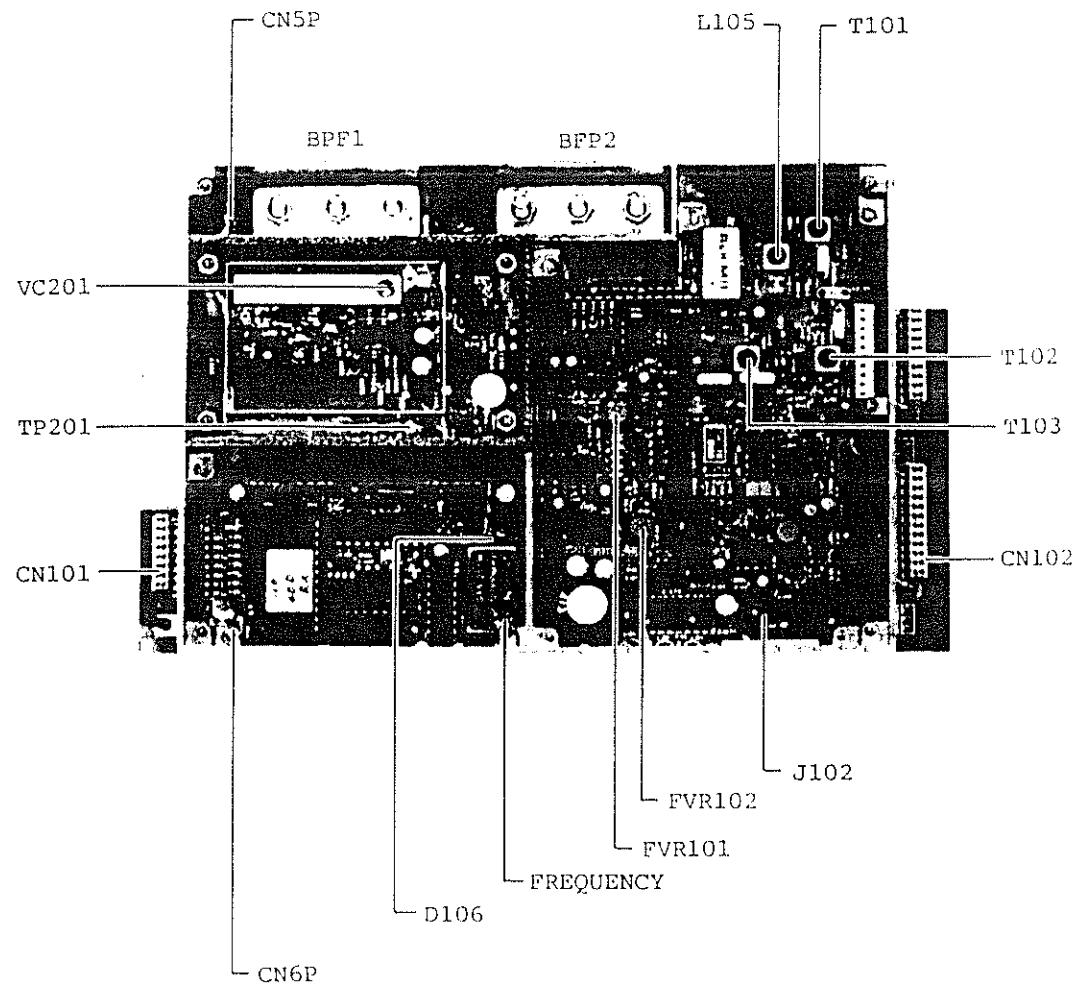

It is recommended that the undermentioned measuring equipment and maintenance tools be properly stored in your maintenance shop for ready use:

1. Circuit Tester
2. RF Power Meter
3. High Impedance Voltmeter
4. AF Generator (600 ohms, 100 through 10,000 Hz)
5. Linear Detector
6. Distortion Meter/Level Meter
7. Directional Coupler
8. Standard Signal Generator
9. Frequency Counter
10. Spectrum Analyzer

6-3 Precautions in Inspection and Adjustment

1. Always use standard-tip screwdrivers that best fit core slots in adjustment. Be very slow and cautious in turning the cores.
2. In adjusting the VCO, never turn trimmer capacitors or cores with an ordinary screwdriver. Be sure to use an RF screwdrivers. Otherwise, adjustments may result in failure due to the effect of stray capacitances.
3. Keep all measuring instruments well calibrated at all times for availability of accurate measurements.

## 6-4-1 RX VCO/PLL Adjustment

RX MAIN UNIT

- (1) Connect a Voltmeter to TP201 and adjust VC201 to read 3V on the Voltmeter.
- (2) Adjust the trimmer in TCXO to obtain an output frequency of 750kHz from CN6P. (No need for adjustment at the site, if the frequency tolerances of the TCXO remain within ±1ppm at room temperature.)

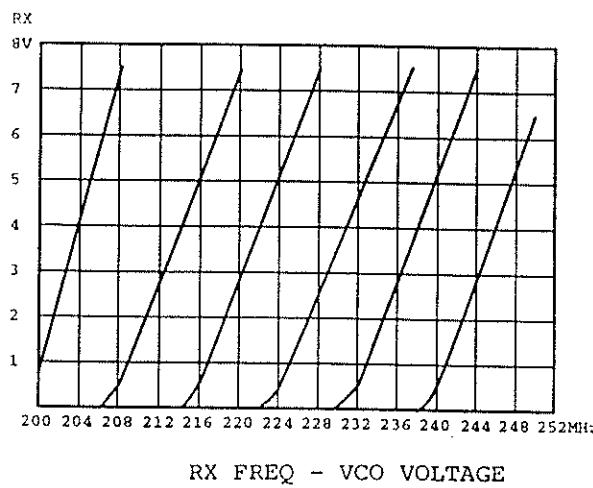

**PRECAUTIONS:**

The radio performs trouble-free operation within the VCO voltage range, 1 to 5V, as read on a voltmeter connected to TP201.

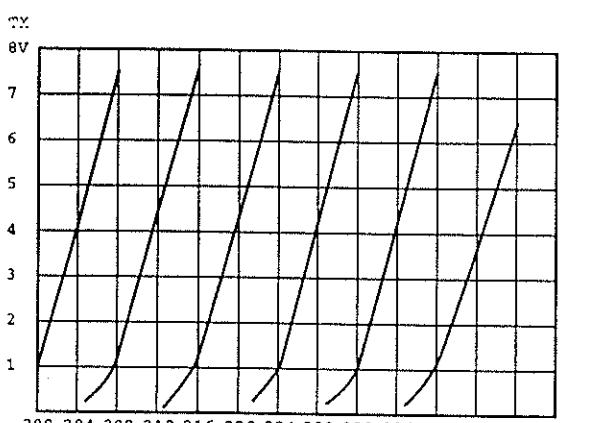

Adjust trimmer capacitor to read 3V (mid-position) on the voltmeter in case of single channel.

In case of multichannel, verify VCO voltages for the lowest and highest frequencies and perform centering so that all fall between 1 and 5V. IF VCO is unlocked in this case, LED (D106) should glow.

Be sure to refer to the RX/TX characteristic curve in adjusting VCO.

RX FREQ - VCO VOLTAGE

TX FREQ - VCO VOLTAGE

**6-4-2 Adjustment of RX Section**

In adjusting the RX Unit singly (without being fixed in BSR), exercise care for the following:

- o J102 turned "ON" Be sure to turn it "OFF" before installing in BSR.
- o Connect a  $10k\Omega$  PULL DOWN resistor array to CN101.

(1) RF Stage Adjustment

Adjust BPF1 and BPF2 for maximum sensitivity points (with a screwdriver).

A better result can be obtained by measurement using a tracking generator.

Note: Where the BSR operates as a base station with a wide RX bandwidth, notify us in advance a wider bandwidth BPF you desire. As shipped from the factory, a standard 3MHz bandwidth BPF is mounted.

(2) IF Stage Adjustment

(1) L105 and T101: Adjust to sensitivity maxima.

(2) T102 and T103: Adjust to SINAD sensitivity maxima, with 1kHz, 70% MOD signal applied to Antenna.

(3) AF Stage Adjustment

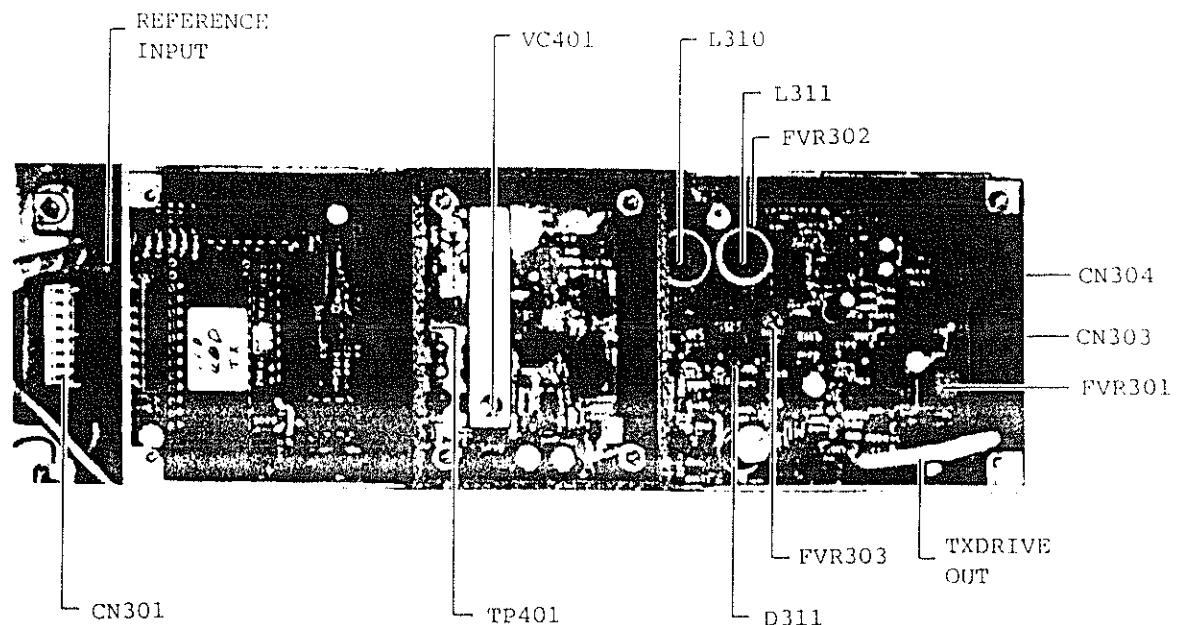

A BTL (Balanced Transformer Line) output obtains from IC111 (NJM2073) as the AF output. The AF output is usually measured with a transformer connected. In the absence of a transformer, adjust between the one-side line and GND.

With a 1kHz 70% modulation signal from a SG applied as input to CN5P, adjust FVR102 so as to make the output level between (8) and (9) of CN102 equal to 0dBm, or adjust FVR102 to obtain -6dBm between (8) or (9) and GND.

(4) RX 3kHz Frequency Response Adjustment

Apply a 1kHz 20% modulation signal from a SG to CN5P, calibrate the receive output level to 0dB, raise the modulation frequency to 3kHz, 20% modulation, and adjust FVR101 to obtain the receive output level of -9.5 ±0.5dB.

6-4-3 TX VCO/PLL Adjustment

- (1) Connect a Voltmeter to TP401 and adjust VC401 to read 3V.
- (2) TCXO for the reference frequency generation is not provided in TX unit; connect RX unit or apply a 750kHz 4 to 8Vp-p signal to the PLL.

PRECAUTIONS:

The radio performs trouble-free operation within the VCO voltage range, 1 to 5V, as read on a voltmeter connected to TP401.

Adjust trimmer capacitor to read 3V (mid-position) on the voltmeter in case of single channel.

In case of multichannel, verify VCO voltages for the lowest and highest frequencies and perform centering so that all fall between 1 and 5V. If VCO is unlocked in this case, LED (D311) should glow.

#### 6-4-4 TX Main Unit Adjustment

In adjusting TX Unit singly (without being fixed in BSR), exercise care for the following:

- o Connect a  $10k\Omega$  PULL DOWN resistor array to CN301.
- o Apply a REFERENCE 750kHz signal.

##### (1) DRIVE Output Adjustment

Connect a power meter to TX DRIVE output and adjust FVR301 to read  $200 \pm 10mW$ .

##### (2) MODULATION Adjustment (Install TX Unit on the BCR)

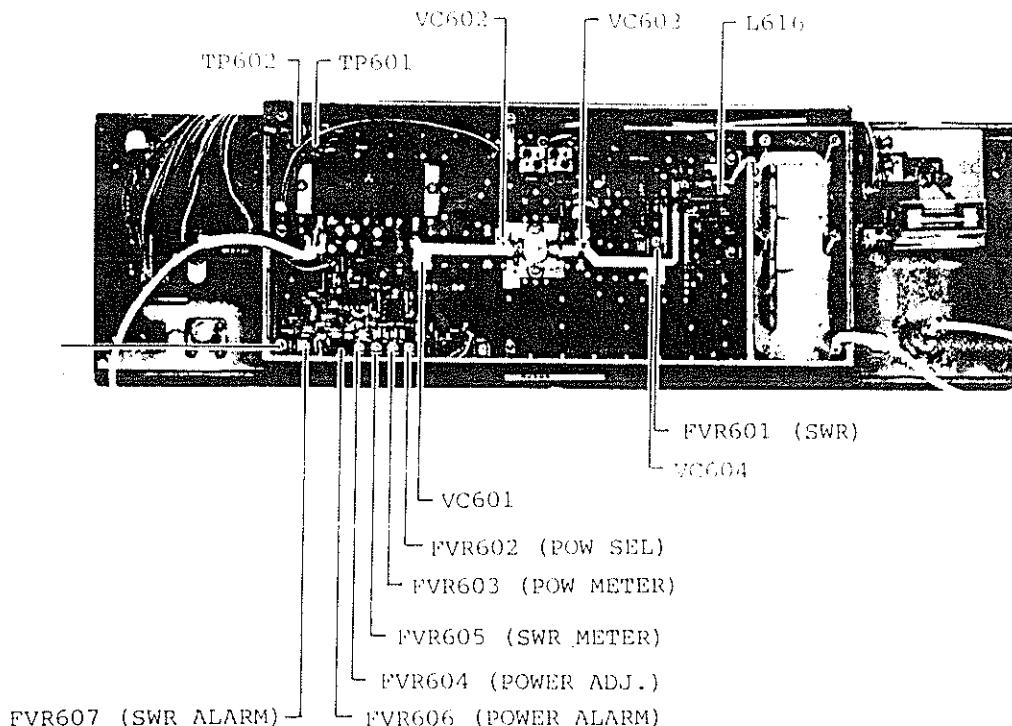

Apply a 1kHz, -34dBm signal from an Audio Generator to MIC connector and adjust FVR303 for a 70% modulation.

Then, raise the input level to 1kHz, -14dBm and adjust FVR302 for a maximum deviation. Repeat this procedure a few times.

##### (3) Adjustment of TX Frequency Response

Adjust L310 and L311 for a  $+9.5 \pm 1dB$  deviation when a REFERENCE 1kHz, 20% modulation signal is varied to a 3kHz, 20% modulation signal.

#### 6-4-5 PA Unit Adjustment

##### (1) POWER Adjustment

Maximize POWER with FVR604 and take a balancing in turning between VC601 - VC604 for an in-band output in excess of 50W.

Then, fix VC601 - VC604 in position to manipulate them no more. Finally, adjust FVR604 to obtain the rated output of 50W.

##### (2) SWR Adjustment

Adjust FVR601 to minimize the L616 line voltage as read on a voltmeter.

##### (3) SWR ALARM Adjustment

LED (1)(6) should remain until from the rated output, as a rule. Adjust FVR607 to provide a visual alarm when ANTENNA is open or shorted.

(4) POWER ALARM Adjustment

With FVR604 set to obtain one-half the rated power, adjust FVR606 to cause LED (D606) to glow under this condition. After adjustment, be sure to restore FVR604 to the initial rated power position.

(5) POWER METER Adjustment

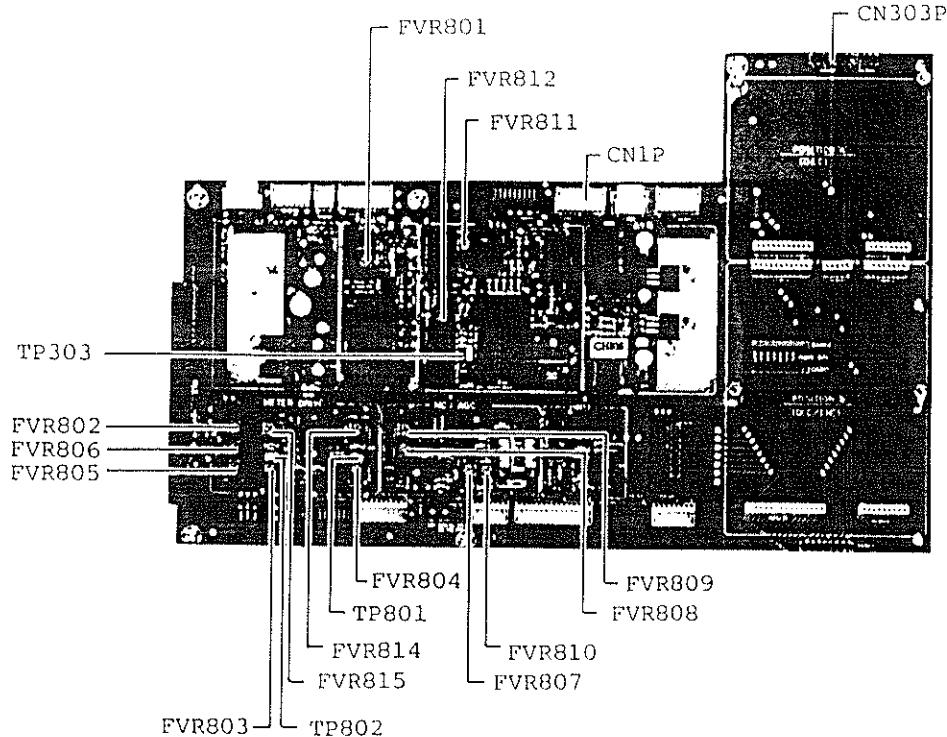

Adjust FVR603 to obtain TP601 voltage of 5.5V under rated power output conditions.

(6) SWR METER Adjustment

Adjust FVR605 to obtain TP602 voltage of 1.3V for rated power and TP602 voltage of 7.3V when ANTENNA is open.

Note: Items (2), (3), (4), (5), and (6) have been adjusted at the factory before shipment. No need for readjustment at the site, unless a trouble occurs

6-4-6 Terminal Unit Adjustment

Terminal Unit is designed not only for overall interconnections of TX Unit, RX Unit, and PA Unit, but also for incorporating functional facilities. Installed on the board which are not used in this model.

(1) Repeater Squelch Level Setting

Adjust FVR801 so that SQL opens at the specified SINAD ratio of 12dB.

(2) Modulation AGC Unit

With the MIC input set at 1kHz, -34dBm, adjust FVR807 to obtain a -8dBm output level from pins (1) and (2) of connector CN303. Then, raise MIC input level to 1kHz, -14dBm and adjust FVR809 to obtain an output level of +2dBm.

(REPEATER MODULATION Adjustment)

Apply a 1kHz, 70% modulation, 40dB $\mu$ V signal from a SG as input and adjust FVR808 to obtain a 70% modulation.

(3) MODULATION Adjustment

Apply a 1kHz, -8dBm signal as input to pins (6) and (7) of CN1P or pins (33) and (34) of D-SUB connector and adjust FVR810 to obtain a 3.5kHz deviation.

Adjustments (1), (2) and (3) have been finished at the factory before shipment. NO need for further adjustments at the site, if no trouble occurs.

## 7. EP-ROM PROGRAM METHOD

### 7-1 Calculating the "Reference Division Rate" Address Data

#### REFERENCE DIVISION RATE "R"

The Reference Division Rate must always be calculated for both the transmit and the receive frequencies.

The 12.000MHz TCXO output signal is divided by 16 (by the divider, IC101) to provide a 750kHz Reference Frequency. This Reference Frequency is sampled and divided by the "Reference Division Rate" to determine the channel spacing, e.g.  $12.000\text{MHz}/16 = 750\text{kHz}$  then  $750\text{kHz}/(\text{Channel Spacing}) = \text{Reference Frequency}$  as follows:

<u>Channel Spacings</u>	<u>Calculations</u>	<u>Ref. Div. Rate "R"</u>
25kHz	$750\text{kHz}/25\text{kHz}$	= 30
12.5kHz	$750\text{kHz}/12.5\text{kHz}$	= 60
10kHz	$750\text{kHz}/10\text{kHz}$	= 75
6.25kHz	$750\text{kHz}/6.25\text{kHz}$	= 120
5kHz	$750\text{kHz}/5\text{kHz}$	= 150

Next it is necessary to determine the address information by referring to the attached "A - D CONVERSION LIST".

e.g. 12.5kHz channel spacing

$$\begin{aligned} &= \text{Reference Division Rate "R"} \\ &= \frac{60}{\overline{C\ 3\ 0}} \end{aligned}$$

### 7-2 Calculating the Transmit and Receive Address Data

It is necessary to calculate the following information for each transmit and receive frequencies required. TX and RX allow two TX and RX data to be written respectively into their EP-ROMs.

(Note: The receive frequency is the 1st local oscillator frequency.)

D = Basic Division Rate

d = Prescaler Division Rate

N = Number of Complete Divisions

R = Remainder of the Basic Division Rate

(a) "D" Calculation

"D" is obtained by dividing the frequency required by the channel spacing required.

(b) "d" Calculation

"d" is the prescaler division rate, and it is fixed at 64.

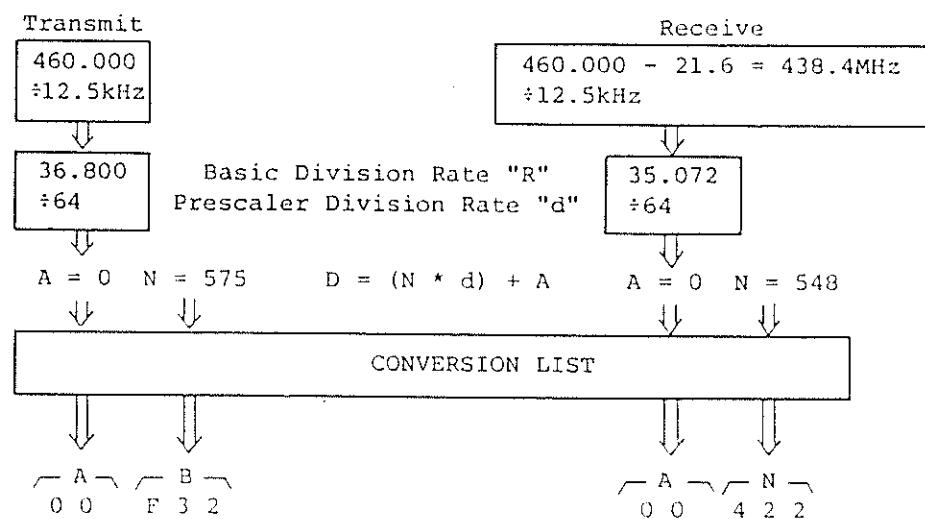

(c) "N" and "A" Calculation

"N" and "A" are calculated using the following equation:

$$D = (N * d) + A$$

(d) Example Calculation

Channel #1 460.000MHz, Simplex, 25kHz Channel Spacing

### 7-3 Relations between Addresses and Data

With BSR, TX and RX units each contain one EP-ROM. As a result, TX data and RX data only are written into TX and RX, respectively.

(Example) CH1 = 460MHz

TX ADDRESS																
Channel #1/#2 address	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
CH1	00	00	01	03	02	0C	03	00	FF							
Buffer input data	10	11	12	13	14	15	16	17	18	19	1A	1B	1C	1D	1E	1F
Channel #3/#4 address	CH3	FF														
Buffer input data	TX(A)	TX(N)	TX(R)													
Channel #5/#6 address	FF															
Channel #99 address	310	311	312	313	314	315	316	317	318	319	31A	31B	31C	31D	31E	31F
Buffer input data	CH99	TX(A)	TX(N)	TX(R)												
	FF															

RX ADDRESS																
Channel #1/#2 address	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
RX(A)	00	00	04	02	02	0C	03	00	FF							
Buffer input data	10	11	12	13	14	15	16	17	18	19	1A	1B	1C	1D	1E	1F
Channel #3/#4 address	RX(A)	FF														
Buffer input data	RX(N)	RX(R)	RX(A)	RX(N)												
Channel #5/#6 address	20	21	22	23	24	25	26	27	28	29	2A	2B	2C	2D	2E	2F
Channel #99 address	310	311	312	313	314	315	316	317	318	319	31A	31B	31C	31D	31E	31F
Buffer input data	RX(A)	RX(N)	RX(R)													
	FF															

Note: An FF data input, though applied to the ROM in programming the ROM, fails to be written into it.
