

ADDENDUM TO IB-8027118-1 *

150 MHz Band Receiver

Low IF and Audio Board

***Replaces IB-8027118-1D**

GENERAL

This addendum provides coverage of a new Low IF and Audio board (3720963-501 and 3720963-502). The -501 version is for use in standard systems while the -502 is for use in systems that require specialized audio and control circuitry such as in repeating stations. Separate coverage is provided for each of the boards which includes "pathfinder" circuit board views, replacement parts lists, and schematic diagrams.

IDENTIFICATION

The newer board may be distinguished from the earlier one by the following:

The earlier board is identified by the number 3457493-501 on the component side of the board and has a 1" by 1" metal plate on the copper side of the board beneath transistor Q1.

The later board is identified by the number 3720963-501 or 3720963-502 on the component side of the board and does not have a metal plate on the copper side.

CIRCUIT DESCRIPTION

3720963-501 Board

Q1 and Q2 are wideband Class A 455 kHz IF amplifiers which supply a high-level signal to Limiter/Driver U1. Q2 is protected from RF overload on strong signals by diode CR2. The diode's conductivity increases in proportion to the voltage across it, shunting a portion of the signal to ground.

Coil L1 in Q2 collector circuit limits the IF bandwidth to around 100 kHz.

Limiter/Driver U1 serves as a limiter for the IF signal and as a driver for the discriminator diodes CR4 and CR5.

In radios without Quiet Channel, speech audio is routed through 6 dB/octave de-emphasis network R31-C63 to Q4. If the radio is equipped with Quiet Channel, R31 is removed and discriminator audio is applied, via pin 24, to the Tone Reject Filter in the Quiet Channel. This filter separates the low frequency encoding tone from the speech audio. The tone is directed to the Quiet Channel circuitry for processing

while the speech audio is routed back to the Low IF and Audio board on pin 25. The de-emphasis function of R31-C63 is duplicated in the Quiet Channel unit.

Transistors Q4 and Q5 form a direct coupled audio amplifier. The output of Q5 is coupled to the volume control through the "blk", "red", and "shld" pins. The audio signal undergoes further de-emphasis in network R43-C44. CR8 provides temperature compensation for Q7 bias circuit.

Transistor Q8 serves as a driver for the Audio PA. Transistor Q9 provides an auxiliary audio output which may be used in special applications.

Noise Operated Squelch

Transistors Q10, Q11, Q12, and Q13 comprise the noise operated squelch circuit. Q10 amplifies the wide band noise supplied from the discriminator. The output of Q10 is rectified by Q11. Components L6 and C62 peak the response to noise around 14 kHz thus avoiding response to speech audio. Q11 output serves as a noise derived control voltage for Schmitt Trigger Q12 and Q13. When noise is present (no signal), Q11 emitter voltage rises, Q12 emitter voltage rises, and Q7 is biased off, muting receiver audio. When a signal of adequate strength is received, discriminator noise is greatly reduced. Under this condition, virtually no noise is present at Q10 or Q11. Q11 emitter voltage drops, Q12 emitter voltage drops, and Q7 is biased on, permitting Q7 to amplify speech audio.

Receiver Disable (Muting)

When a disable (keying) voltage is applied to pins 18 or 32, transistor Q16 is biased into conduction. Diode CR13 clamps the trigger voltage at nine volts to provide a constant reference for Q16, regardless of variations in the keying voltage. The positive voltage at Q16 emitter triggers squelch gate Q12/Q13 into the tight squelch mode disabling the receiver. This disables; audio output to audio PA at pin 2, repeat audio output at pin 38 (group 502), and keying output to COS or DCM at pin 28. When the disable voltage is removed, the charge on capacitors C42 and C50 hold Q16 "on" for an instant. This allows sufficient time for the receiver noise-squelch circuitry to mute the receiver eliminating the "squelch tail".

Jumper JU1 is provided to isolate the receiver disable circuit from the keying voltage during transmit. This feature is necessary to permit the receiver to operate during transmit in a duplex repeater station. The receiver may still be muted with a disable voltage applied to pin 18.

3720963-502 Board

The preceding description of the -501 module also applies to the -502 version. The following additional information describes the operation of the added circuitry on the -502 board.

Special Metering/Control Output

Part of Q1's output is rectified by CR1, and delivered to pins 39 and 40 as a DC voltage. The output of Q1 is linear and is significant only on stronger signals. This output can be used for specialized metering or control applications.

Discriminator Audio Output

Some applications require discriminator grade audio. Part of the discriminator output is fed, via R25 and C34, to Q3, which provides a low impedance output. Q17 is used to switch this output on or off. Q17 is normally non-conducting and allows normal passage of the audio signal. When a control voltage (+12 V) is applied to pin 36 or by way of JU3, Q17 provides a low impedance path for the audio signal to ground, disabling the output of Q3.

Squelch Disable (Receiver Test)

A+ applied at pin 82 biases Q15 on, dropping its collector voltage and disabling the squelch gate, turning on the receiver audio.

Repeat Audio Output

For repeater applications, a frequency contoured, 600 ohm output is provided. Q5 output is buffered by Q6 and supplied at pin 38. Q14 (part of the squelch circuit) switches this output by switching Q4-Q5 on or off.

OPTIONS AND MODIFICATIONS

When field installing options, certain modifications must be made to the Low IF board.

1. Carrier Operated Switch (COS): On Low IF board, add jumper JU4 between the two holes marked "JU4".
2. Dual Channel Monitor: On Low IF board, add jumper JU4 between the two holes marked "JU4".
3. Quiet Channel (QC): Remove R31. Also remove jumper between pins 18 and 20.

Any of the optional circuits appearing on the 3720963-502 board can be added to the 3720963-501 board by the field technician. All of the parts used in these circuits are shown on the schematic and parts list for the -502. The location of the parts can be determined from the "pathfinder" illustration or from the stenciling on the board.

TUNING CHANGES

In the "Receiver Alignment" table in the Receiver Instruction Book, make the following changes for tuning the newer Low IF board:

1. Delete Step 2.
2. In Step 3, change "14Z2" to read "14L2".
3. In Step 4, change "14Z3" to read "14L3".

Note that these changes apply only to the 3720963-501 and -502 Low IF boards.

LOW IF MODULE 14

3720963-501 CODE A,B,C,D,E,F

NOTES

1. FOR INTERCONNECTIONS TO OTHER MODULES, SEE FUNCTIONAL DIAGRAMS IN SYSTEM BOOK.
2. CIRCLED LETTERS (G) ON DIAGRAM ARE ALSO MARKED ON COPPERTRACK SIDE OF MODULE FOR LOCATION PURPOSES.
3. RESISTORS ARE 1/4 WATT, 10% EXCEPT AS NOTED.
4. CAPACITORS ARE IN UF EXCEPT AS NOTED.
5. DC VOLTAGES MEASURED WITH 20,000 OHMS/VOLT VOM (GROUND LEAD TO CHASSIS).

GRAMS IN SYSTEM BOOK
TRACK SIDE OF MODULE FOR

6. AC RMS VOLTAGES MEASURED WITH LOW-CAPACITY, HIGH IMPEDANCE INPUT AC VOLTMETER.
7. ADJUSTMENT PROCEDURE FOR R60: CONNECT VOM BETWEEN PIN 30/9V (+) AND CHASSIS (-).
WITH NORMAL LOAD AND IN RECEIVE MODE, ADJUST R60 FOR +9.0 V.
8. FOR FIXED SQUELCH: PULL LEAD FROM PIN 11 AND ADD R100 TO BOARD (SEE DIAGRAM FOR LOCATION).
R100 VALUE IS 2200 OHMS FOR THRESHOLD SENSITIVITY, JUMPER FOR TIGHT SQUELCH.

9. ABBREVIATIONS: QC = QUIET CHANNEL S = SIGNAL
COS = CARRIER OPERATED SWITCH OS = OPEN SQUELCH
NS = NO SIGNAL TS = TIGHT SQUELCH
