Cut out the label at the right, and place it behind the clear plastic window in the spine of the manual.

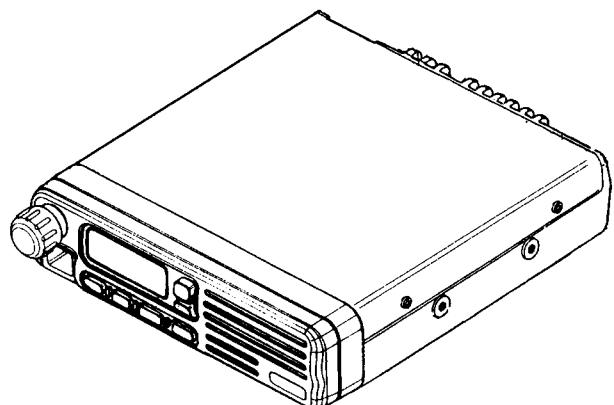

VX-3000V
Service Manual

Introduction

4 channel version

48 and 120 channel versions

This manual provides technical information necessary for servicing the VX-3000V VHF Land Mobile transceiver. It does not include information on installation and operation, which are described in the VX-3000V Operating Manual, provided with each transceiver, or on VX-3000V accessories, which are described in manuals provided with each.

The VX-3000V is carefully designed to allow the knowledgeable operator to make nearly all adjustments required for various station conditions, modes and operator preferences simply from the controls on the panels, without opening the case of the transceiver. The VX-3000V Operating Manual describes these adjustments, plus certain internal settings.

Servicing this equipment requires expertise in handling surface mount chip components. Attempts by non-qualified persons to service this equipment may result in permanent damage not

covered by warranty.

For the major circuit boards, each side of the board is identified by the type of the majority of components installed on that side.

In most cases one side has only chip components, and the other has either a mixture of both chip and lead components (trimmers, coils, electrolytic capacitors, packaged ICs, etc.), or lead components only.

While we believe the technical information in this manual is correct, Vertex Standard assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated. Vertex Standard reserves the right to make changes in this transceiver and the alignment procedures, in the interest of technological improvement, without notification of the owners.

Specifications

General

Frequency Range (version):	134 ~150 or 146 ~ 174 MHz (VHF high-band vers. A/C, respectively)
No. of Channels & Spacing:	4, 48 or 120 channels 30-kHz, 25-kHz spacing and 12.5-kHz spacing
Modes of Emission:	16K0F3E ,11K0F3E (direct frequency modulation)
Frequency Stability:	$\pm 0.00025\%$
Antenna Requirements:	50 ohms, unbalanced (SO-239 socket)
Voltage Requirements:	11.8 to 15.6 V DC, negative ground
Current Consumption (approx.):	400 mA Stby, 1.4A Rx, 13 A Tx
Operating Temperature Range:	-30 to +60 °C (-22 to +140 °F)
Size (WHD, approx.):	160 x 40 x 160 mm (6-1/4 x 1-1/2 x 6-1/4 inch)
Weight (approx.):	1.4 kg (3.1 lbs.)

Receiver

Receiver Circuit Type:	Double Conversion Superheterodyne
Intermediate Frequencies:	21.4 MHz , and 455 kHz (all models)
Sensitivity:	0.25/0.3 μ V for 12-dB SINAD 0.35/0.45 μ V for 20 dB NQ
Hum & Noise Ratio:	Better than 46 dB for 25-kHz/step, Better than 38 dB for 12.5-kHz/step
Adjacent Channel Selectivity:	>70 dB for 25-kHz/step, >60 dB for 12.5-kHz/step
Intermodulation Distortion:	Better than 70 dB
Spurious Rejection:	Better than 70 dB
External Audio Output Power:	10 watts into 4 ohms with <10% THD

Transmitter

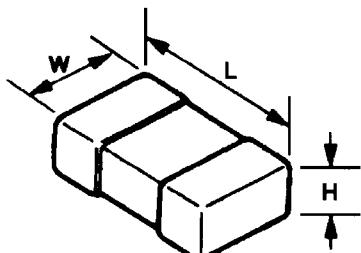

Power Output:	50/5 watts (high/low, programmable)
Modulation Type/Deviation:	Frequency Modulation, ± 5 kHz (± 2.5 kHz)
Hum & Noise Ratio:	Better than 46 dB for 25-kHz/step, Better than 38 dB for 12.5-kHz/step
Modulation Distortion:	Less than 5%
Spurious Emissions:	Better than 70 dB (below carrier)
Microphone Impedance:	600 Ohms

Specifications are subject to change without notice or obligation.

Chip Component Information

The diagrams below indicate some of the distinguishing features of common chip components.

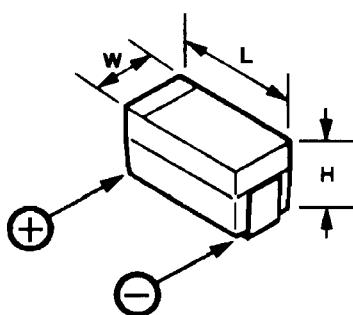

Capacitors

Chip Component Information

Replacing Chip Components

Chip components are installed at the factory by a series of robots. The first one places a small spot of adhesive resin at the location where each part is to be installed, and later robots handle and place parts using vacuum suction.

For single sided boards, solder paste is applied and the board is then baked to harden the resin and flow the solder. For double sided boards, no solder paste is applied, but the board is baked (or exposed to ultra-violet light) to cure the resin before dip soldering.

In our laboratories and service shops, small quantities of chip components are mounted manually by applying a spot of resin, placing with tweezers, and then soldering by very small dual streams of hot air (without physical contact during soldering). We remove parts by first removing solder using a vacuum suction iron, which applies a light steady vacuum at the iron tip, and then breaking the adhesive with tweezers.

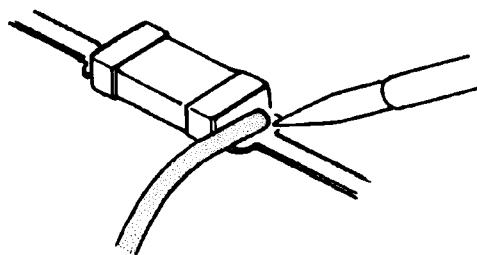

The special vacuum/desoldering equipment is recommended if you expect to do a lot of chip replacements. Otherwise, it is usually possible to remove and replace chip components with only a tapered, temperature-controlled soldering iron, a set of tweezers and braided copper solder wick. Soldering iron temperature should be below 280°C (536°F).

Precautions for Chip Replacement

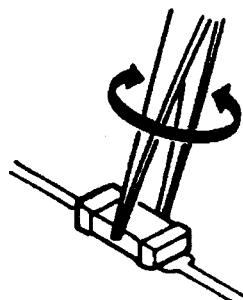

- Do not disconnect a chip forcefully, or the foil pattern may peel off the board.
- Never re-use a chip component. Dispose of all removed chip components immediately to avoid mixing with new parts.
- Limit soldering time to 3 seconds or less to avoid damaging the component and board.

Removing Chip Components

- Remove the solder at each joint, one joint at a time, using solder wick whetted with non-acidic fluxes as shown below. Avoid applying pressure, and do not attempt to remove tinning from the chip's electrode.

- Grasp the chip on both sides with tweezers, and gently twist the tweezers back and forth (to break the adhesive bond) while alternately heating each electrode. Be careful to avoid peeling the foil traces from the board. Dispose of the chip when removed.
- After removing the chip, use the copper braid and soldering iron to wick away any excess solder and smooth the land for installation of the replacement part.

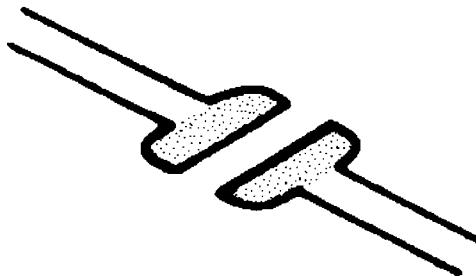

Chip Component Information

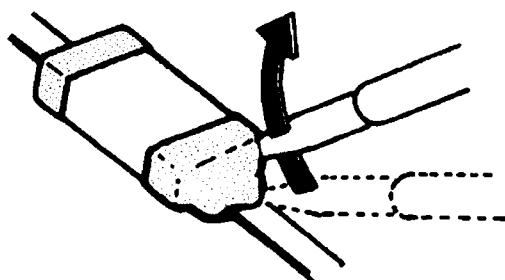

Installing a Replacement Chip

As the value of some chip components is not indicated on the body of the chip, be careful to get the right part for replacement.

- Apply a small amount of solder to the land on one side where the chip is to be installed. Avoid too much solder, which may cause bridging (shorting to other parts).

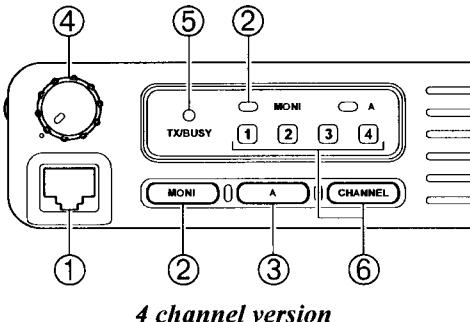

- Hold the chip with tweezers in the desired position, and apply the soldering iron with a motion line as indicated by the arrow in the diagram below. Do not apply heat for more than 3 seconds.

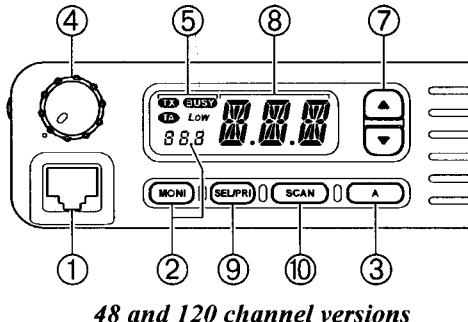

- Remove the tweezers and solder the elec trode on the other side in the manner just described.

Operation Manual Reprint

Controls & Connectors

4 channel version

48 and 120 channel versions

① Microphone Jack

Press the microphone plug firmly into this jack until it locks. To remove the microphone, press the lever protruding from the bottom side of the plug while pulling it out.

② MONI Button & Indicator

This button selects the squelch (receiver muting) mode. When the indicator is off, tone (or coded) squelch is active. When you press **MONI** momentarily, the “**MONI**” indicator blinks (4 channel version) or a small Dot [●] will be displayed (48/120 channel versions); in this condition, only the “noise” squelch is active, and any station which transmits on the channel will be heard. Pressing **MONI** and holding it in for more than 1.5 second, on the other hand, will open the squelch completely, and background noise will be heard if no signal is present (both the small Dot and the “**BUSY**” indicator will appear on the 48/120 channel versions, while “**MONI**” will glow steadily on the 4-channel version).

If you hear constant background noise, with no signals present (“**MONI**” glows steadily or “**BUSY**” and the small Dot are both present), press the **MONI** button once to return to the previous (quiet) tone-squelched mode.

③ A (Accessory) Button

In VHF Low-band versions, this button can be set by your dealer to activate the noise blanker. Otherwise, this button (and the orange indicator above it) can be set up for special applications, such as high/low power selection, talk-around, and call alert functions, as determined by your network requirements and programmed by your Yaesu dealer.

④ VOLUME and POWER On/Off Knob

Turn this control clockwise to turn the radio on and to increase the volume. Turn it counterclockwise into the click-stop to turn the radio off.

The following items are unique to 4-channel versions:

⑤ TX/BUSY Indicator Lamp

This lamp glows green when the channel is busy, and red during transmission by your radio.

⑥ CHANNEL Numbered Indicators & Button

Press the **CHANNEL** button to select the operating channel; the channel number currently in use will light up on the display.

The remaining items are unique to 48 and 120-channel versions:

⑤ BUSY/TX Indicators

This “**BUSY**” icon appears when the channel is busy, and “**TX**” appears while transmitting.

⑦ CHANNEL Selector Buttons (▲) and (▼)

Push one of these keys to select the operating channel, as shown on the display.

⑧ Numeric Channel Display

The display includes an 3-character numeric section showing channel and group numbers plus status and identity information. Additional indicators on the display show priority channel assignments (“**Pr1**” and “**Pr2**”) and scan channel selection (“**E**” means “Enabled for scanning”).

⑨ SEL/PRI Button

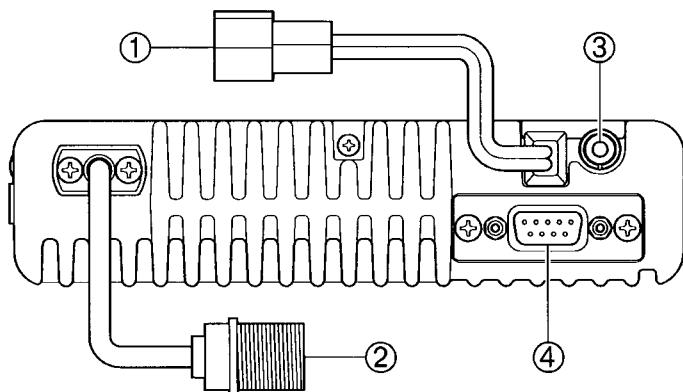

This button allows selection of memory channel groups, and (together with the **SCAN** button) selects scanning modes (Dealer, User, Priority/Dealer, Priority/User, Group/Dealer, Group/User, Dealer DW, User DW) as described in the next chapter, *Basic Operation of the Transceiver*.

⑩ SCAN Button

This button is used to activate (current group) channel scanning, to select and deselect channels for scanning, and (together with the **SEL/PRI** button) to select scanning modes, as described in the next section. Pressing the **SCAN** button for more than 1.5 second enables scanning of *all* channels (in all groups).

Operation Manual Reprint

REAR (Heatsink)

① 13.8-V DC Cable Pigtail w/Connector

The supplied DC power cable must be connected to this 2-pin connector. Use only the supplied (fused) cable, extended if necessary, for power connection.

② Antenna Cable with Connector

The 50-ohm coaxial feedline to the antenna must be connected here, using a "UHF" type (PL-259) plug.

③ External Speaker Jack

An external loudspeaker may be connected to this 2-contact, 3.5-mm mini-phone jack.

Caution: Do not connect this line to ground, and be certain that the speaker has adequate capability to handle the audio output from the VX-3000.

④ DSUB 9-Pin Data Connector

External TX audio line input, PTT (Push To Talk), Squelch, and external RX audio line output signals may be obtained from this connector for use with accessories such as data transmission/reception modems, etc.

Operation Manual Reprint

Basic Operation of the Transceiver

Important! - Before turning on the radio the first time, confirm that the power connections have been made correctly and that a proper antenna is connected to the antenna jack.

Turn the **VOLUME/POWER** knob clockwise to turn on the radio. The display will become illuminated (48/120 channel versions), or the channel indicator will light up (4 channel version). The radio will start up on the last channel used prior to shut-down during the previous operating session.

In 4-channel versions, press the **CHANNEL** button to change channels. In the 48/120 channel versions, the display should show either a channel number or scan mode indicator (**DSC**, **USC**, **GDS**, **GUS**, **PDS**, **PUS**, **DDW** or **UDW**). If “**ERR**” is displayed instead, the transceiver has not yet been programmed with channel frequencies; switch off the power and contact your network administrator or Yaesu dealer. If a scan mode indicator is displayed, you can press the **SCAN** button to display a channel number, and then press either the **UP** (▲) or **DOWN** (▼) button to change channels.

Setting the Volume

If no signals are heard and the “**BUSY**” indicator or “**TX/BUSY**” LED is not illuminated, press and hold the **MONI** button for 1.5 second until background noise is heard and the “**MONI**” or “**BUSY**” indicator glows. Then adjust the volume control for a comfortable level on the background noise. Press **MONI** button again momentarily so the “**MONI**” or “**BUSY**” indicator disappears.

Transmitting

To transmit, wait until the “**BUSY**” indicator is off (the channel is not in use), and press the **PTT** (Push-To-Talk) switch on the side of the microphone (the “**TX**” indicator will appear or the “**TX/BUSY**” lamp will glow red). While holding in the **PTT** switch, speak across the face of the microphone in a clear, normal voice level, and then release the **PTT** switch to receive.

Automatic Time-Out Timer

If the selected channel has been programmed for automatic time-out, you must limit the length of each transmission. While transmitting, a beep will sound five seconds before time-out. Another beep will sound just before the deadline; the “**TX**” indicator will disappear and transmission will cease soon thereafter. To resume transmitting, you must release the **PTT** and wait for the “penalty timer” to expire (if you press the **PTT** before this timer expires, the timer restarts, and you will have to wait another “penalty” period).

The remaining instructions apply to 48-channel or 120-channel versions only:

Selecting Groups and Channels

- Press the **SEL/PRI** button (repeatedly, if necessary) to select a different group of channels.
- Press the **UP** (▲) or **DOWN** (▼) button to select a different channel *within the current group*.
- When you select a group, its number appears as the first digit in the new channel number which appears on the display (in other words, channel “305” represents channel #**05** in channel group #**3**).

Scanning Modes

There are eight scanning modes, described in the list below. Each channel can be independently enabled or disabled for scanning; only channels selected for scanning within the enabled group are scanned. Also, as mentioned before, each group can have up to two priority channels which are scanned more often than the non-priority channels.

The SCAN modes and their corresponding displays are as follows:

Display	Scanning Function
DSC	Dealer Scan (only within the current group)
USC	User Scan: only user-selected channels (only within the current group)
GDS	Group Dealer Scan: scan all Dealer-selected channels in all groups
GUS	Group User Scan: scan all User-selected channels in all groups
PDS	Priority Dealer Scan: DSC plus priority channel(s)
PUS	Priority User Scan: USC plus user priority channel(s)
DDW	Dealer Dual Watch: Monitor one channel and priority channel(s)
UDW	User Dual Watch: Monitor User-selected channel and priority channel(s)

Scanning Operation

With the microphone in its hanger, press the **SCAN** button momentarily to activate scanning. Typically, “**DSC**” will initially appear on the display, indicating Dealer Channel Scan as the scanning mode. If you wish to change to one of the modes described in the list above, press the **SEL/PRI** button repeatedly until that mode appears on the display.

If you pick up the microphone while no signal is being received, operation will shift to a particular channel. Which channel that will be depends on which of the following options the dealer has programmed for off-hook channel selection:

Scan Start Channel

Lifting the microphone causes operation to revert to the group and channel last selected before scanning started or resumed.

Operation Manual Reprint

Priority Revert

Lifting the microphone activates the Priority 1 channel in the current group. If no channel is assigned level 1 priority, operation will be on the Priority 2 channel. If no priority channels have been assigned, operation reverts to the Scan Start Channel.

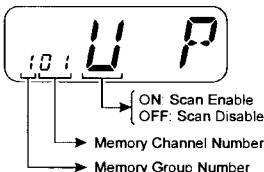

Last Busy

Lifting the microphone causes operation to revert to the group and channel where activity was last detected. If no activity was detected since turning on the radio, operation reverts to the Scan Start Channel.

How to Select Channels to be Scanned

If your radio has been configured by your Dealer to allow you, the operator, to make changes to the list of channels to be scanned, you can make these changes by following this simple process:

- ① Turn the transceiver OFF by rotating the **VOLUME/POWER** control fully counter-clockwise into the click-stop.
- ② Press and hold in the **SEL/PRI** button; while holding this button in, rotate the **VOLUME/POWER** control clockwise out of the click-stop to turn the radio on. You may now release the **SEL/PRI** button.
- ③ Press the **A** button, as necessary, until the Memory Group and Memory Channel numbers will appear in *small* characters in the *left side* of the display area.
- ④ You may now push the **SEL/PRI** key momentarily as many times as necessary to choose the Memory Group within which you wish to make changes to the channel scan list. Once you have selected the desired Memory Group, you may use the **UP (▲)** or **DOWN (▼)** button to choose a particular channel within the current group.

Pressing the **MONI** button will change the scanning status of the selected channel.

If you are *adding* the channel to those you wish to scan, pressing the **MONI** button causes a “**U**” appear on the display, indicating that the channel has been added to the User Scan List. If you are *deleting* the channel from the User Scan List (the channel’s data itself will not be deleted; the channel just will not be scanned), the “**U**” will disappear.

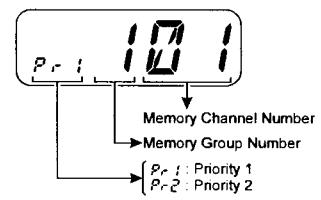

- ⑤ Repeat step 4 for each channel you wish to enable or disable for scanning.
- ⑥ When you are done making changes to the channels you wish to scan, press and hold in the **SEL/PRI** button for more than 1.5 second. Operation will return to its normal status, and the display will revert to its previous appearance.

How to Change the “User Priority” Channels

Your Dealer may have configured your radio so as to allow you to make changes to the “User Priority” Channels (the channels

you designate to be scanned more frequently than the others). The selection process is almost identical to that used for making changes to the User Scan List.

- ① Turn the transceiver OFF by rotating the **VOLUME/POWER** control fully counter-clockwise into the click-stop.
- ② Press and hold in the **SEL/PRI** button; while holding this button in, rotate the **VOLUME/POWER** control clockwise out of the click-stop to turn the radio on. You may now release the **SEL/PRI** button.
- ③ Press the **A** button, as necessary, until the Memory Group and Memory Channel numbers will appear in *large* characters in the *right side* of the display area (as compared to *small* characters in the case of changes to the Scan List).
- ④ You may now push the **SEL/PRI** button momentarily as many times as necessary to choose the Memory Group within which you wish to make changes to the User Priority Channel(s). Once you have selected the desired Memory Group, you may use the **UP (▲)** or **DOWN (▼)** button to choose a particular channel within the current group.

Pressing the **SCAN** button will change/assign the Priority status of the selected channel.

If you are assigning the channel to Priority status, pressing the **SCAN** button causes “**Pr1**” or “**Pr2**” to flash on the display, indicating that the channel has been assigned the status of **Priority 1** or **Priority 2**, respectively. Pressing the **SCAN** button repeatedly toggles the Priority Level between “**1**” and “**2**.” If you are *deleting* the channel from Priority status, the “**Prn**” indicator will disappear.

- ⑤ Repeat step 4 for each channel you wish to assign to or delete from Priority status.
- ⑥ When you are done making changes to the Priority Channels, press and hold in the **SEL/PRI** button for more than 1.5 second. Operation will return to its normal status, and the display will revert to its previous appearance.

The **A** Button Function

The **A** (Accessory) button can be programmed by the dealer to provide two of the other functions described below. In the case of the VHF Low-Band version of the VX-3000, pressing the **A** button can activate the Noise Blanker (a feature not available on the VHF High-Band or UHF versions).

To activate the primary Accessory function, press the **A** button momentarily. To access the secondary Accessory function (which may include the Alarm), press the **A** button and hold it in for 1.5 seconds or longer.

Call/Reset

When this feature is programmed and an selective call has been received (the “**CAL**” indicator is flashing), momentarily press the **A** button to reset the flashing indicator and mute the receiver, otherwise press the **A** button to send your

Operation Manual Reprint

radio's identification code (ANI) to the dispatcher.

Low Power

With this feature enabled, the **A** button toggles between high and low transmitter power, as programmed by the dealer.

Talk-Around

The feature causes the **A** button to select simplex operation on semi-duplex channels: the transmit frequency becomes the same as the receive frequency (regardless of any programmed offset for the channel).

Note: This feature has no effect on simplex channels. After pressing the button, “**TA**” is displayed on the LCD.

Noise Blanker

Because local noise can be particularly troublesome in the VHF Low-Band frequency spectrum, the Low-Band version of the VX-3000 includes a Noise Blanker feature, which may be toggled on and off by pressing the **A** button for the appropriate length of time.

Encryption

When the Voice Scrambler feature is enabled, pressing the **A** button toggles the Scrambler on and off.

A-On

When this function is enabled, the Noise Blanker will be activated (on the VHF Low-Band version); in other versions, this Accessory function is reserved for future optional features.

Alarm Function

When the “alarm” function is enabled, pressing and holding the **A** button for 1.5 seconds causes the radio to revert to a specially-designed channel, and causes the special “Alarm” identifier code to be transmitted automatically.

Note: this feature is only available as a “Secondary” Accessory to prevent accidental activation.

Accessory Connector

1. Abstract

The rear panel's D-SUB 9-pin connector is a versatile accessory interfacing point. This connector includes the following functions:

- TX audio, RX audio and PTT.
- Field Editor switch
- FSK DATA input/output
- HORN Alert output
- SQL output
- Ignition-controlled power switch

All these functions can be programmed by jumpers on the RF-UNIT.

2. Pin assignments /selectable pins

① **SQ**: Squelch output

Open collector output. Maximum sink current 50mA.
Maximum voltage 13.6V (DC power supply)
Sink: A signal is present (Squelch is open)
Open: No signal is present (Squelch is closed)
When using the FSK DATA mode, this pin is controlled by FSK detector.

② **EXT_RX_AUD**: External received audio output

High impedance output (approx. 3K Ohms)
This output is enabled as a default setting at the factory.
This function is enabled by jumper JP1004 on the RF-UNIT.

③ **RXD**: Received DATA output

TTL level (+5V / 0V) output.
In the FSK mode, this line is a Received DATA output.
This function is enabled by jumpers JP1003 and JP1015 on the RF-UNIT.
When you use this output, remove the solder from jumper J1004.

④ **EXT_MIC**: External MIC input

High impedance input (approx. 10K Ohms)
Input level: 5.5mV_{rms}
This input is enabled as a default setting at the factory.
This function is enabled by jumper JP1006 on the RF-UNIT.
This feature requires activation via the Clone Editor software (check the EXTERNAL MIC flag in the group settings).

⑤ **TXD**: Transmit DATA input

TTL level (+5V / 0V) input.

In the FSK mode, this line is a Transmit DATA input.
This function is enabled by jumpers JP1005 and JP1016 on the RF-UNIT.

When you use this output, remove the solder from jumper J1006.

⑥ **DTR**: Field editor program key input (Active Low)

When you use the Field Editor, this pin must be connected to GND.

Connect to GND: Field Editor available

Open: Field Editor not available (normal mode)

This function is enabled by jumper JP1007 on the RF-UNIT.

JP1008 is a reserved jumper.

⑦ **GND**: Signal Ground

⑧ **HO_AL**: Horn Alert output (Active Low)

Open collector output. Maximum sink current 50mA.
Maximum voltage 13.6V (DC power supply).

Sink: Horn Alert on

Open: Normal

⑨ **PTT**: (Active Low)

TTL level (+5V / 0V) input. This line is internally pulled up to +5V DC.

When pulled low by an external device, it keys the transceiver's transmitter section.

⑩ **13V**

Switched DC 13.6V output for powering an external accessory.

Maximum current 250mA.

This line fuse is F1001 on the RF-UNIT.

This function is enabled by jumper JP1010 on the RF-UNIT. This feature is enabled as a default setting at the factory.

⑪ **5V**

Switched and regulated DC 5V output for powering an external accessory.

Maximum current 50mA.

This function is enabled by jumper JP1009 on the RF-UNIT.

⑫ **IGN**: Car Ignition sense

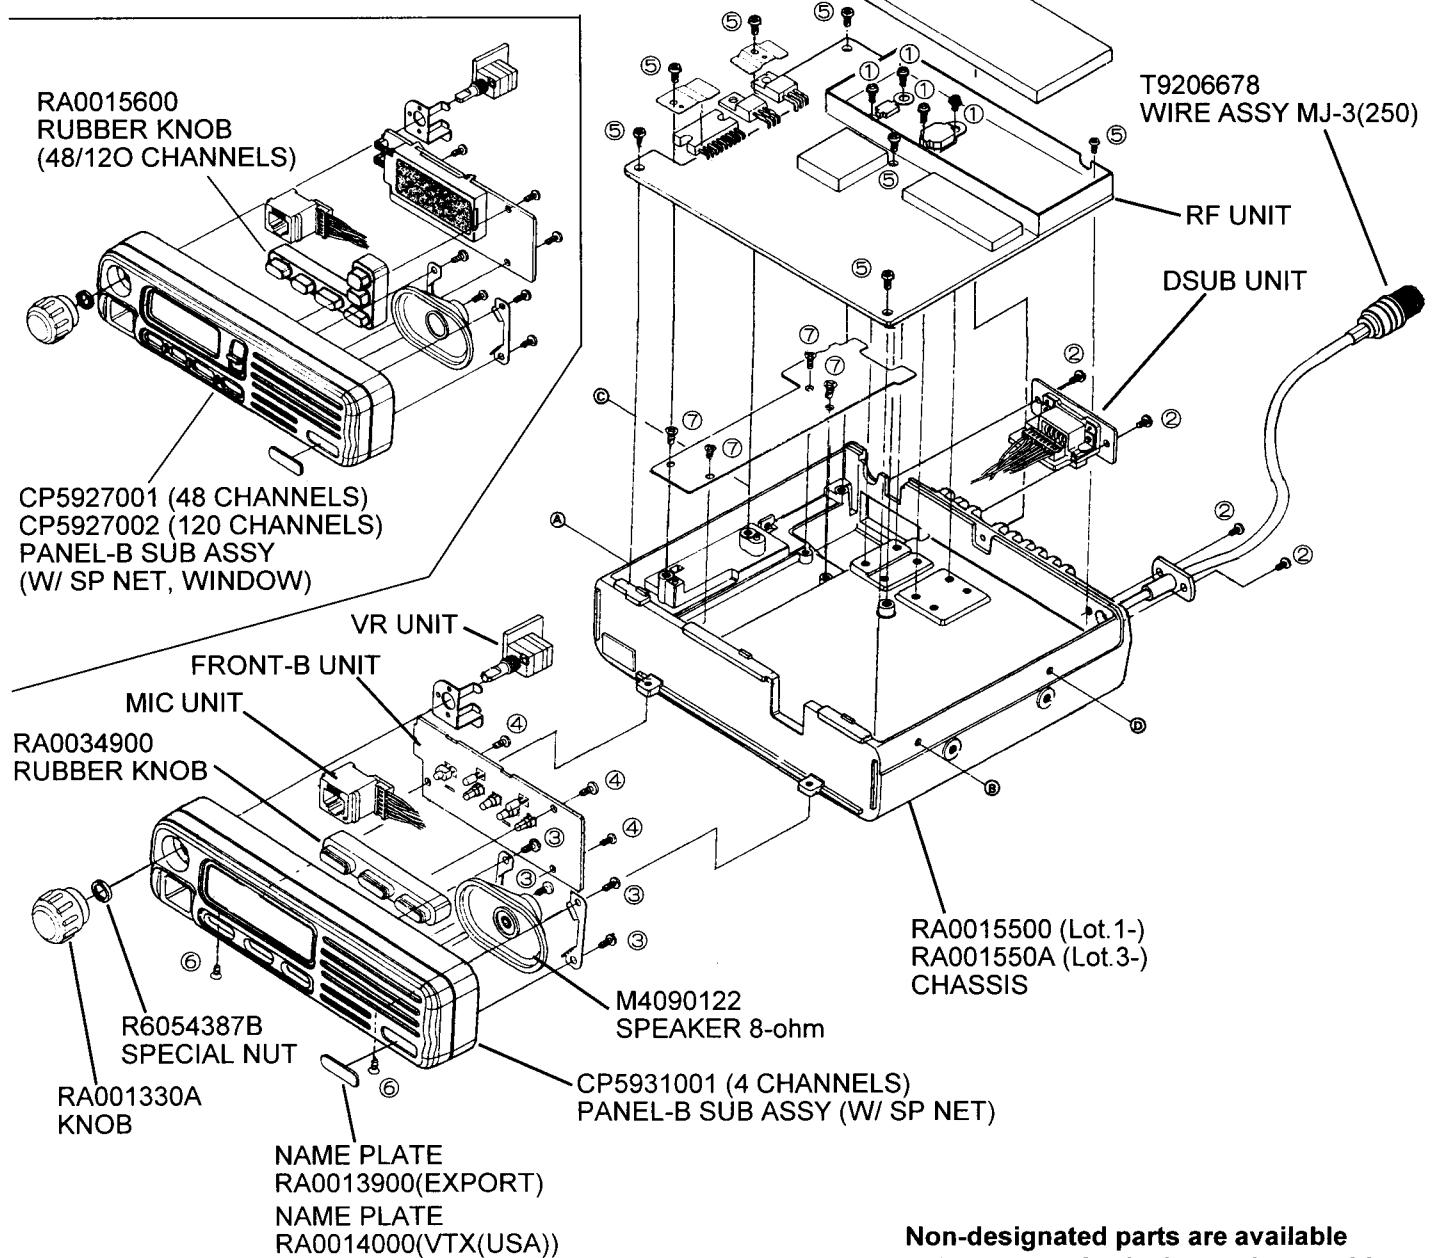

This pin enables power switch control via the car ignition.
To use this function, remove R1187 and mount R1188 10K Ohms.

Then connect this pin to your car's (ignition-controlled) DC line.

Notes:

The VX-3000V is carefully aligned at the factory for the specified performance across the frequency range specified for each version. Realignment should therefore not be necessary except in the event of a component failure, or altering version. All component replacement and service should be performed only by an authorized Vertex Standard representative, or the warranty policy may be void.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently are placed, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Vertex Standard service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Vertex Standard service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Vertex Standard reserves the right to change circuits and alignment procedures in the interest of improved performance, without

notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards.

Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

Required Test Equipment

- RF Signal Generator with calibrated output level at 200 MHz
- Deviation Meter (linear detector)
- In-line Wattmeter with 5% accuracy at 200 MHz
- 50- Ω RF Dummy Load with power rating 100 W at 200 MHz
- 4- Ω AF Dummy Load
- Regulated DC Power Supply adjustable from 3 to 15 VDC, 15 A
- Frequency Counter with 0.2 ppm accuracy at 200 MHz
- AF Signal Generator

Alignment

- AC Voltmeter
- DC Voltmeter
- VHF Sampling Coupler
- SINAD Meter
- IBM PC/compatible Computer with Microsoft Windows v3.1 or later operating system
- VPL-1 Connection Cable & Alignment Program

Alignment Preparation & Precautions

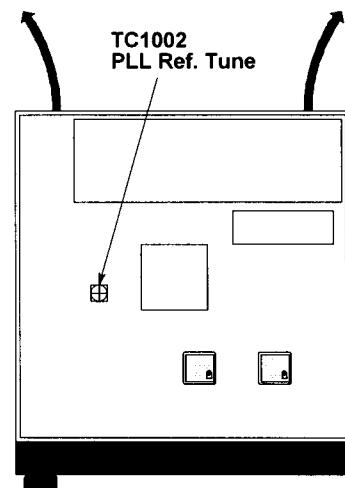

A 50- Ω RF dummy load and in-line wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

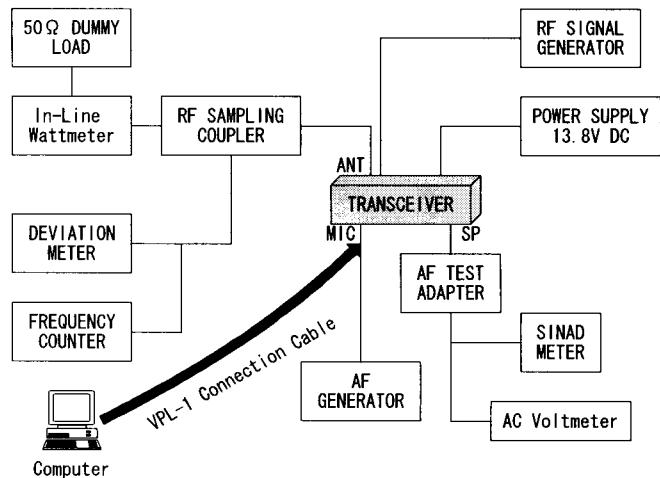

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 and 30°C (68 and 86°F). When the transceiver is brought into the shop from hot or cold air, it should be allowed time to come to room temperature before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in the alignment procedure are based on $0dB\mu=0.5\mu V$.

RF unit Alignment Points

Alignment Setup

Set up the test equipment as shown for transceiver alignment, and apply 13.8V DC power to the transceiver. Refer to the drawings above for Alignment Points.

The transceiver must be programmed for use in the intended system before alignment is attempted. The RF parameters are loaded from the file during the alignment process.

To facilitate alignment over the complete switching range of the equipment, the channel data in the transceiver should first be uploaded to the computer and stored to disk. Alignment channels at the upper, lower and middle band edges should then be downloaded to the trans-

Alignment

ceiver. The original data can be replaced at the end of the alignment process.

The alignment mode is accessed by "Auto mode" command from the computer when switching on.

Channels	Frequency (Simplex)	
	Ver. A	Ver. C
LOW	134.000	146.000
MID	142.000	160.000
HIGH	150.000	174.000

In the alignment mode, normal operation is suspended. Use the control command from the computer to change the list of test functions.

PLL & Transmitter

Set up the test equipment as shown above for transmitter alignment. Maintain the supply voltage constant at 13.8 V for all steps.

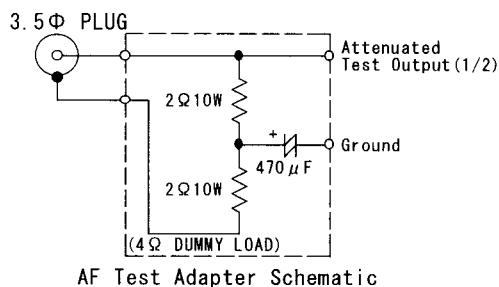

PLL Reference Frequency

Select the MID channel and key the transmitter. Adjust TC1002 on the RF unit, if necessary, so the counter frequency is within 100 Hz of the channel center frequency for the transceiver version. Also verify that the HIGH and LOW channels are also within tolerance.

Note!

Because of the bridge audio amplifier circuit used in the VX-3000V, it is necessary to construct and use a simple audio load test adapter as shown in the schematic diagram above, when conducting receiver alignment steps.

Do not connect either side of the speaker leads to chassis "ground".

Alignment

Transmitter parameters except PLL Reference Frequency

In the alignment mode, the transmitter parameters are stored by control commands from the computer (Command + Setting Data). The transmitter parameters, commands and data are shown below.

Transmitter parameters

Parameters	Control Command		Data	
	1 st	2 nd	Fixed	Variable
TX Power (HIGH)	C4	—	01	01~FF(h)
TX Power (MID)	C4	—	02	01~FF(h)
TX Power (LOW)	C4	—	03	01~FF(h)
MIC Sensitivity	B4	47	—	01~FF(h)
Microphone Deviation (WIDE)	B4	4D	—	01~FF(h)
Microphone Deviation (NARROW)	B4	6D	—	01~FF(h)
TX CTCSS Deviation (WIDE)	B4	54	—	01~FF(h)
TX CTCSS Deviation (NARROW)	B4	74	—	01~FF(h)
TX DCS Deviation (WIDE)	B4	43	—	01~FF(h)
TX DCS Deviation (NARROW)	B4	63	—	01~FF(h)
TX DTMF Deviation (WIDE)	B4	44	—	01~FF(h)
TX DTMF Deviation (NARROW)	B4	64	—	01~FF(h)
TX 2/5 Tone Deviation (WIDE)	B4	57	—	01~FF(h)
TX 2/5 Tone Deviation (NARROW)	B4	77	—	01~FF(h)
TX FFSK Deviation (WIDE)	B4	46	—	01~FF(h)
TX FFSK Deviation (NARROW)	B4	66	—	01~FF(h)

Receiver parameters

In the alignment mode, the receiver parameters are stored by control commands from the computer (Command + Setting Data). The receiver parameters, commands and data are shown below.

Receiver parameters

Parameters	Control Command		Data	
	1 st	2 nd	Fixed	Variable
SINAD Sensitivity	B4	51	—	01~FF(h)
Squelch (WIDE)	B4	53	—	01~FF(h)
Squelch (NARROW)	B4	73	—	01~FF(h)
AF Out (WIDE)	B4	41	—	01~FF(h)
AF Out (NARROW)	B4	61	—	01~FF(h)
Line Out (WIDE)	B4	4C	—	01~FF(h)
Line Out (NARROW)	B4	6C	—	01~FF(h)
CTCSS Decode	B4	58	--	01~FF(h)
DCS Decode	B4	59	--	01~FF(h)

Circuit Description

RECEIVER

1. Receive Signal Path

Incoming signals from the antenna jack within the frequency range of the transceiver are delivered to the RF UNIT and pass through a low-pass filter and band-pass filter consisting of coils L1016, L1017, L1018, L1009, L1005 & L1006, capacitors C1094, C1104, C1105, C1107, C1108, C1072, C1032, C1043, C1033, C1034, C1020, C1016, C1035, C1044 & C1036, and antenna switching diode D1013 (**UM9957F**).

The RF signal is then amplified by Q1007 (**2SC5226**) and filtered by a varactor-tuned band-pass filter consisting of coils L1004 & L1031, capacitors C1038, C1028, C1029, C1124, C1164, C1030 & C1039, and diodes D1004 & D1005 (both **HVU350**) before application to first mixer Q1004 (**SGM2016M**).

Buffered output from Receive VCO Q1018 (**2SK508**) is amplified by Q1017 (**2SC5226-4/5**) to provide a pure first local signal between 112.6 and 152.6 MHz for injection to first mixer Q1004 (**SGM2016M**) along with the amplified receive RF signal. The 21.4-MHz first mixer product then passes through monolithic crystal filters XF1001 & XF1002 (**21S102A**, 10-kHz BW) to strip away all but the desired signal, which is then amplified by Q1005 (**2SC2620**) before application to FM IF subsystem IC Q1008 (**TA31136FN**), which contains the second mixer, second local oscillator, limiter amplifier, noise amplifier, and S-meter amplifier.

The 455-kHz second local signal is derived from 20.945-MHz crystal X1001 for mixing with the first IF signal within Q1008. The resulting second IF passes through ceramic filter CF1001 (**PBFS455P9DR**) or CF1002 (**PBFS455P12DR**)

to strip away unwanted mixer products, and is applied to the limiter amplifier in Q1008 to remove amplitude variations in the 455-kHz IF before demodulation by ceramic discriminator CD1001 (**CDBC450C24X**).

Detected audio from Q1008 is applied to Baseband Audio Coprocessor Q1047 (**SC11372**) for de-emphasis and band-pass filtering, and then via the volume control to audio amplifier Q1043 (**TDA1519A**), providing up to 10 watts receiver audio output to the optional external speaker jack or internal 4- Ω loudspeaker.

2. Squelch Control

The squelch circuitry consists of a noise amplifier & band-pass filter within Q1008, and amplifier Q1006 (**2SC4116**) before noise detector D1002/D1003 (**MA143**).

When no carrier is received, noise at the output of the detector stage in Q1008 is amplified and band-pass filtered by the noise amplifier within Q1008 and the network between pins 7 and 8. The resulting high-frequency noise is amplified by Q1006 before rectification by D1002/D1003, and the resulting DC squelch control voltage is applied to A/D converter input pin 30 of microprocessor Q1045 (**HD64F3334YF16**). When no carrier is received, this signal causes pin 52 of Q1045 to go low, and pin 53 of Q1045 to go high. Pin 53 turns on Q1046 (**UN5213**) ON to mute audio amplifier Q1043, while pin 52 opens squelch gate Q1044 (**TC4S66F**) to remove input from the audio amplifier. Thus, the microprocessor inhibits output from the audio amplifier, silencing the receiver when no signal is being received, and during transmission.

When a carrier appears at the discriminator,

Circuit Description

noise is suppressed from the squelch control voltage applied to the A/D converter in (Q1045), causing pin 52 of Q1045 to go high, and pin 53 to go low, closing squelch gate Q1044 and unmuting audio amplifier Q1043 by turning Q1046 OFF, respectively.

Demodulated receive audio from Q1008 is de-emphasized and amplified by the de-emphasis amplifier section of Q1047, and then band-pass filtered by the band-pass filter section of Q1047. If the audio was scrambled by voice-band inversion at the transmitter, it is descrambled by the voice-band inverter section within Q1047 to recover clear speech.

If a received signal contains a subaudible tone or ANI code sequence, it is detected by Baseband Audio Coprocessor Q1047 and compared to the tone or code stored in microprocessor Q1045. If the received tone or code matches that programmed, the microprocessor stops scanning, if active, and allows audio to pass through audio amplifier Q1043 to the loudspeaker.

TRANSMITTER

1. Transmit Signal Path

Speech input from the microphone is delivered from the FRONT UNIT to Baseband Audio Coprocessor Q1047 (**SC11372**) on the RF UNIT, which includes microphone amplifier, pre-emphasis, limiter and low-pass filter stages for transmit audio.

After pre-emphasis, the limiter amplifier within Q1047 applies IDC (Instantaneous Deviation Control) and splatter filtering to the speech signal, to suppress any high-frequency audio components that could result in over-

deviation.

The processed audio from Q1047 is applied through Q1041 (**TA7550IF**) to varactor D1031 (**HVU350**), which frequency modulates transmit PLL VCO Q1025 (**2SK508-K52**) oscillating at the transmitting frequency up to ± 2.5 or ± 5 kHz from the unmodulated carrier.

If a CDCSS or CTCSS code is enabled for transmission, the modulating code is generated by microprocessor Q1045 and Baseband Audio Coprocessor Q1047 and applied to varactor D1032 (**HVU350**) to modulate 14.4-MHz PLL reference oscillator Q1030 (**2SC4116GR**) so as to produce the desired tones in the transmit PLL VCO output.

If DTMF is enabled for transmission, the tones are applied to the splatter filter section of Baseband Audio Coprocessor Q1047 instead of the speech audio. The DTMF tones are also amplified for monitoring in the loudspeaker.

The modulated signal from transmit PLL VCO Q1025 (**2SK508**) is buffered by Q1017 (**2SC5226**) and then amplified by Q1013 (**2SC5019**), predriver Q1016 (**2SC4767**), driver Q1015 (**2SC2539**) and finally RF power amplifier Q1014 (**2SC2630**) up to 45 watts.

2. Automatic Power Control (APC)

RF output from the final amplifier is sampled by C1106 and C1109 and rectified by D1024 (**1SS319**). The resulting DC is applied to comparator Q1026 (**TA75S01**) along with power control DC voltage from microprocessor Q1045. Output voltage from the comparator is amplified by Q1027 (**2SC4116**) to regulate the supply voltage to predriver Q1016 through Q1020

Circuit Description

(**2SB1182**), controlling the gain of the predriver so as to maintain the RF power output determined by the power control voltage from the microprocessor. The microprocessor allows selecting either high, or one of two low power levels.

3. Transmit Inhibit

When the transmit PLL is unlocked, pin 7 of PLL chip Q1019 goes to a logic low, switching Q1009 (**2SA1586**) so that Q1010 (**UN5215**) output goes high. The resulting DC unlock control voltage is applied to pin 14 of microprocessor Q1045. While the transmit PLL is unlocked, pin 62 of Q1045 remains high, inhibiting supply of power to the transmit circuitry by supply switch Q1037 (**XN1213**) and Q1035 (**2SB1201**).

4. Spurious Suppression

Generation of spurious products by the transmitter is minimized by the fundamental carrier frequency being equal to the final transmitting frequency, modulated directly in the transmit VCO. Harmonic spurious suppression is provided by a low-pass filter consisting of L1016, L1017 & L1018 and C1104, C1105, C1107 & C1108, resulting in more than 60 dB of harmonic suppression prior to delivery to the antenna.

5. PLL Frequency Synthesizer

5-1. Frequency Reference

Stability is maintained by a regulated 5-V supply Q1024 & Q1032 (**2SB1132 & MM1216**). Supply voltage to 14.4-MHz reference crystal X1001 is temperature compensated by thermistor TH1001 (**NTCCM20123NH153**) and Q1055 (**2SC4116**) at high temperatures, and thermistor

TH1002 (**NTCCM20123SH223**) and Q1002 (**2SA1586**) at low temperatures.

5-2. Synthesizer

PLL circuitry on the RF UNIT consists of Receive VCO Q1018 (**2SK508**), Transmit VCO Q1025 (**2SK508**), VCO buffer Q1017 (**2SC5226**), and PLL subsystem IC Q1019 (**MB15A02**), which contains a reference divider, serial-to-parallel data latch, programmable divider, phase comparator and charge pump.

During receive, Receive VCO Q1018 (**2SK508**) oscillates between 112.6 and 152.6 MHz according to the transceiver version and the programmed receiving frequency. A sample of the VCO output buffered by Q1017 is applied to the prescaler section at pin 8 of Q1019. There the VCO signal is divided by 64 or 65 and 128 or 129, according to a control signal from the data latch section of Q1019, before being applied to the programmable divider section.

The data latch section of Q1019 also receives serial dividing data from microprocessor Q1047, which causes the pre-divided VCO signal to be further divided in the programmable divider section, depending upon the desired receive frequency, so as to produce a 5-, 6.25- or 7.5-kHz derivative of the VCO frequency. Meanwhile, the reference divider section of Q1019 divides the 14.4-MHz reference from oscillator Q1030 (**2SC4116GR**) to produce a reference signal corresponding to the PLL derivative.

The 5-, 6.25- or 7.5-kHz signal from the programmable divider (derived from the VCO) and that derived from the reference oscillator are applied to the phase detector section of Q1019, which produces a pulsed output with pulse duration depending on the phase difference

Circuit Description

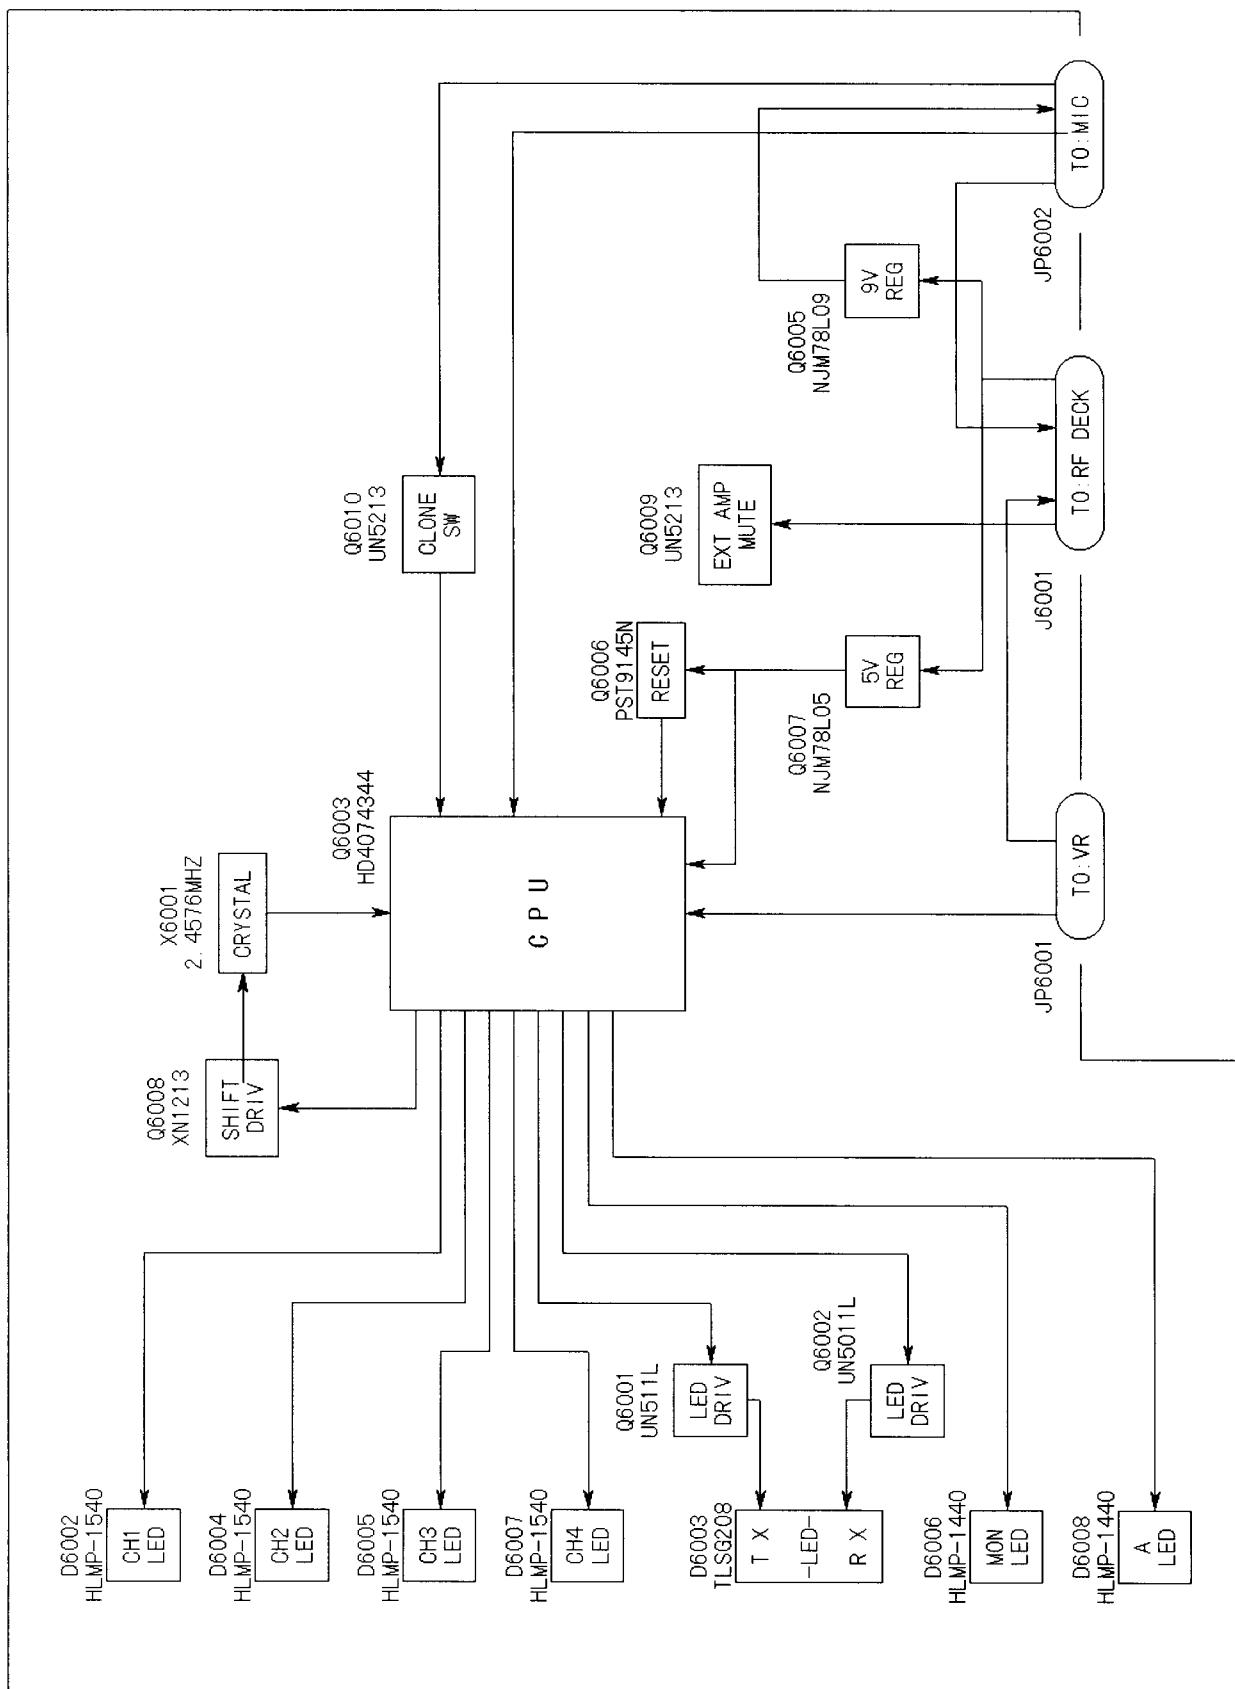

between the input signals. This pulse train is filtered to DC and applied to varactors D1020, D1021, D1022 and D1023 (all **HVU350**). Changes in the level of the DC voltage applied to the varactors affects the reactance in the tank circuit of the VCO, changing the oscillating frequency of the VCO according to the phase difference between the signals derived from the VCO and the crystal reference oscillator. The VCO is thus phase-locked to the crystal reference oscillator.

The output of Receive VCO Q1030, after buffering by Q1017, is applied to the first mixer as described previously.

During transmission, Transmit VCO Q1025 oscillates between 134 and 174 MHz according to the version and programmed transmit frequency. The remainder of the PLL circuitry is shared with the receiver. However, the dividing data from the microprocessor is such that the VCO frequency is at the actual transmit frequency (rather than offset for IFs, as in the receiving case). Also, the VCO is modulated by speech audio applied to D1031 (**HVU350**), as described previously.
